Contents

List of contributing authors — XI

Lukas Hartmann, Thomas Krieg and Dirk Holtmann

1 Intensification of bioprocesses – definition, examples, challenges and future directions — 1

1.1 Defining of PI in biotechnology — 1
1.2 Examples of PI in biotechnology — 2
1.3 Current challenges and future direction of PI implementation in biotechnology — 5
References — 7

Eduardo J. S. Brás and Pedro Carlos de Barros Fernandes

2 Miniaturization and microfluidic devices: an overview of basic concepts, fabrication techniques, and applications — 17

2.1 Introduction — 17
2.2 Microfabrication techniques: advantages and limitations — 19
2.2.1 Thermoplastic patterning techniques — 20
2.2.2 Glass patterning techniques — 22
2.2.3 Laser ablation — 22
2.2.4 PDMS patterning — 23
2.2.5 Additive manufacturing — 24
2.3 Fluid dynamics and the microfluidic environment — 24
2.3.1 Characteristic dimension — 24
2.3.2 Reynolds number — 25
2.3.3 Péclet number — 26
2.3.4 Schmidt and Prandtl numbers — 26
2.3.5 Capillary number — 26
2.3.6 Damköhler number — 27
2.4 Bioprocess development through microfluidics — 27
2.4.1 Screening systems — 27
2.4.2 Upstream processing – biocatalysis — 28
2.4.3 Upstream processing – cell-based approaches — 31
2.4.4 Downstream processing — 33
2.5 Conclusions — 37
References — 37

Yunting Liu, Shiqi Gao, Pengbo Liu, Weixi Kong, Jianqiao Liu and Yanjun Jiang

3 Integration of chemo- and bio-catalysis to intensify bioprocesses — 45

3.1 Introduction — **45**

3.2 Temporal compartmentalization strategy — **46**

3.3 Spatial compartmentalization strategy — **50**

3.3.1 Biphasic systems — **50**

3.3.2 Aqueous micellar solutions — **52**

3.3.3 Encapsulation — **54**

3.3.4 Semi-permeable membrane separation — **55**

3.4 Nanoreactors — **56**

3.4.1 Chemical- or enzyme-nanoreactors — **56**

3.4.2 Metal-enzyme co-immobilization — **59**

3.4.3 Bioconjugation — **63**

3.5 Discussion and conclusions — **64**

References — **66**

André Delavault, Katrin Ochsenreither and Christoph Syldatk

4 Intensification of biocatalytic processes by using alternative reaction media — 71

4.1 Introduction — **71**

4.2 Organic solvents as media — **73**

4.2.1 Anhydrous or nearly anhydrous neat organic solvent systems — **77**

4.2.2 Organic solvents mixed with aqueous buffers: one-phase and two-phase systems — **79**

4.3 Low-transition-temperature mixtures (LTTMs) — **81**

4.3.1 General principles and definitions — **81**

4.3.2 Ionic liquids (ILs) — **82**

4.3.3 Deep eutectic solutions (DES) and naturally deep eutectic solutions (NADES) — **83**

4.3.4 Use of LTTMs for biocatalysis — **84**

4.4 Diverse reaction systems for biocatalysis — **88**

4.4.1 Supercritical fluids — **88**

4.4.2 Gas, liquid and solid solvent free approaches — **89**

4.5 Conclusions — **90**

References — **91**

Johannes Möller, Kim B. Kuchemüller and Ralf Pörtner

5 Bioprocess intensification with model-assisted DoE-strategies for the production of biopharmaceuticals — 95

5.1 Introduction — **95**

5.2 Model assisted process development — **97**

5.2.1 Mathematical models for model-assisted process design — **97**
5.2.2 Strategies for model-assisted process development — **99**
5.3 Critical aspects of data generation for setting up mechanistic mathematical models — **100**
5.3.1 Problems related to the determination of metabolic values — **101**
5.3.2 Impact of culture conditions and scale on model parameters — **101**
5.3.3 Advanced experimental strategies for data generation and evaluation used for model-set up — **103**
5.4 Case study: application of model-assisted DoE within a knowledge-driven workflow — **103**
5.5 Application potential of mDoE methods — **109**
References — **112**

Axel Schmidt, Alina Hengelbrock and Jochen Strube

6 Continuous biomanufacturing in upstream and downstream processing — 117
6.1 Introduction — **117**
6.1.1 Biopharma 4.0 and sustainability — **119**
6.1.2 Challenges and opportunities in continuous manufacturing — **121**
6.2 Case studies — **122**
6.2.1 Monoclonal antibodies — **122**
6.2.2 Fragments — **129**
6.2.3 Peptides — **133**
6.2.4 Virus-like-particles — **142**
6.2.5 pDNA to mRNA — **148**
6.2.6 Cell therapies — **158**
6.3 Conclusions — **161**
References — **162**

Markus Stöckl, André Gemünde and Dirk Holtmann

7 Microbial electrotechnology – Intensification of bioprocesses through the combination of electrochemistry and biotechnology — 173
7.1 Introduction – how can electrochemistry be used to intensify bioprocesses? — **173**
7.2 Fundamental mechanisms of the microbial electrotechnology (MET) — **174**
7.3 Applications of microorganism in BES — **177**
7.3.1 Microbial fuel cells — **177**
7.3.2 Cathodic microbial electrosynthesis — **178**
7.3.3 Anodic microbial electrosynthesis — **179**
7.3.4 Electrofermentation — **180**
7.3.5 Paired electrolysis cells or microbial electrolysis cells — **180**

7.3.6 Secondary microbial electrochemical technologies — **181**
7.4 Key performance indicators describing the MET — **182**
7.5 Case study – secondary microbial electrosynthesis based in formic acid — **185**
7.6 Conclusions — **186**
References — **187**

Michael E. Runda and Sandy Schmidt
8 Light-driven bioprocesses — 193
8.1 Introduction — **193**
8.2 Basic principles and terms in light-driven bioprocesses — **195**
8.3 Photocatalytic regeneration cascades via direct or indirect activation of redox enzymes — **198**
8.3.1 Indirect photoactivation of redox enzymes — **199**
8.3.2 Direct photoactivation of redox enzymes — **202**
8.3.3 Light-driven cofactor supply using photoautotrophs — **204**
8.3.4 Photocatalytic generation of hydrogen peroxide *in situ* — **206**
8.4 Natural and artificial photoenzymes for (non-natural) photo-biocatalytic reactions — **207**
8.4.1 Natural photoenzymes — **207**
8.4.2 Artificial photoenzymes — **208**
8.4.3 Photoinduced enzyme promiscuity — **211**
8.5 Photoenzymatic cascades combining photo- and biocatalytic transformations — **212**
8.5.1 Simultaneous and sequential photochemoenzymatic cascades — **214**
8.5.2 Photoenzymes in biocatalytic cascades — **216**
8.6 Current challenges of applying light in bioprocesses — **217**
8.7 Conclusions — **219**
References — **219**

Sera Bolat, Raphael Greifenstein, Matthias Franzreb and Dirk Holtmann
9 Process intensification using immobilized enzymes — 227
9.1 Introduction — **227**
9.2 Short introduction in enzyme immobilization procedures — **229**
9.3 Supports for enzyme immobilization — **233**
9.3.1 Whole cell biocatalysts — **235**
9.3.2 Performance indicators — **236**
9.3.3 Case study – Immobilization of unspecific peroxygenases — **237**
9.4 Conclusions — **242**
References — **242**

Ulises A. Salas-Villalobos and Oscar Aguilar

10 *In situ* product removal — 247

10.1 ISPR classification — **251**

10.2 Solid–liquid ISPR — **252**

10.2.1 Membrane bioreactors — **252**

10.2.2 Adsorption — **254**

10.3 Liquid–liquid ISPR — **256**

10.3.1 Aqueous two-phase systems (ATPS) — **256**

10.3.2 Organic solvent extraction — **258**

10.4 Gas–liquid system (stripping) — **260**

10.5 Conclusions and future trends — **261**

References — **262**

Anna Dinius, Zuzanna J. Kozanecka, Kevin P. Hoffmann and Rainer Krull

11 Intensification of bioprocesses with filamentous microorganisms — 265

11.1 Introduction — **266**

11.2 Cellular morphology and its influence on productivity — **268**

11.2.1 Micro-morphology — **269**

11.2.2 Macro-morphology — **272**

11.2.3 Product formation — **277**

11.3 Methods for structure elucidation — **281**

11.3.1 Image analysis — **281**

11.3.2 Particle size analysis by laser light diffraction — **283**

11.3.3 Pellet slicing and confocal laser scanning microscopy — **284**

11.3.4 Flow cytometry — **285**

11.3.5 X-ray microtomography — **287**

11.3.6 Pellet sedimentation — **288**

11.3.7 Pellet mechanics — **289**

11.3.8 Oxygen microelectrode technique — **289**

11.4 Bio-intensification strategies in filamentous microorganisms — **291**

11.4.1 Microparticle supplementation — **292**

11.4.2 Macroparticle supplementation — **294**

11.4.3 Salt supplementation — **296**

11.4.4 Supplementation of surface-active agents — **297**

11.4.5 Combination of multiple morphology engineering approaches — **301**

11.5 Conclusions — **302**

References — **304**

12 Process intensification in biopharmaceutical process development and production – an industrial perspective — 313

12.1 Introduction — **314**
12.2 Basic concepts for process intensification — **321**
12.3 Technical aspects and engineering principles for process intensification — **325**
12.3.1 Upstream — **326**
12.3.2 Downstream — **327**
12.4 Chemically defined cell culture media for intensified CHO processes — **331**
12.4.1 General requirements — **331**
12.4.2 Media for pre-stage perfusion — **331**
12.4.3 Media for HSD fed batch processes — **332**
12.5 Scientific approaches supporting process intensification — **333**
12.5.1 Systems Biotechnology — **333**
12.5.2 Advanced data analysis and modeling — **334**
12.6 PAT tools — **335**
12.6.1 Upstream — **336**
12.6.2 Downstream — **340**
12.7 Examples for intensified CHO cell culture processes producing therapeutic antibodies — **340**
12.7.1 HSD fed batch process in stainless steel bioreactor — **340**
12.7.2 Continuous perfusion process in single-use bioreactor — **342**
12.8 Cell line and clone selection aspects — **342**
12.9 Economic considerations — **345**
12.9.1 Facility modeling — **346**
12.9.2 Cost of goods modeling — **347**
12.10 Sustainability aspects — **351**
12.11 Summary and future perspectives — **353**
References — **354**
