Preface	xiii
List of figures	xv
List of tables	xix
List of abbreviations and acronyms	xxi
1 Local-scale patterns in species richness	1
1.1 Local-scale trends in species richness	1
1.2 What is species richness?	1
1.3 What is meant by "local" variations in species richness?	3
1.4 Local-scale patterns are most noticeable in organisms that don't move around much	4
1.5 A related and important question: How do species coexist <i>anywhere</i> ?	4
1.6 Different scales of species richness, from local to geographical	14
1.7 A varied environment tends to allow more species in	16
1.8 Using models to validate the logic of the role of disturbance in allowing coexistence	21
1.9 Do humpback curves really occur along disturbance gradients?	23
1.10 Grime and Tilman: disturbance creates other sorts of opportunities for coexistence, and variation in levels of disturbance affects these opportunities	25
1.11 When strategies mix—the humpback curve with succession, after a disturbance	26
1.12 The "other" humpback curve: along gradients in nutrient levels	27
1.13 Species richness is a balancing act between the effects of disturbance and nutrients	33

1.14	Why hasn't a humpbacked diversity curve been found for animals?	35
1.15	A quite different explanation for humpbacked diversity curves in plants, in relation to soil fertility	37
1.16	"Poisoned" and "extreme" environments are usually poor in species.	40
1.17	Mountain-scale patterns in species richness.	41
1.18	Patterns of species richness with depth in the oceans	44
1.19	Some conclusions about local-scale patterns in species richness. .	45
2	The Holy Grail of ecology: Latitudinal gradients	47
2.1	Latitudinal trends	47
2.2	The discovery of latitudinal trends	48
2.3	Explaining latitudinal gradients	55
2.4	Non-equilibrium theories: species richness can just keep on rising	60
2.4.1	The effects of ice ages	60
2.4.2	"The tropics are more benign"	64
2.4.3	A general test of the disequilibrium theories: Has the build-up of species richness continued over time?	79
2.5	Equilibrium theories: there is a lid on species richness that is higher in the low latitudes	81
2.5.1	The tropics are just bigger	81
2.5.2	More energy, more food in warmer climates: the "species-energy hypothesis"	81
2.5.3	More strongly seasonal environments mean less chance of occupying a narrow, specialized niche	85
2.5.4	More specialized enemies of plants mean more species can exist side by side at lower latitudes (the Janzen-Connell hypothesis)	87
2.5.5	The latitudinal gradient is produced by a balance between growth and disturbance	92
2.6	The pros and cons of the various theories for latitudinal gradients	94
3	Deep time and mass extinctions	97
3.1	The depth of time	97
3.2	Species richness can change on a range of time scales.	98
3.3	Sampling the past: the fossil record and species richness	98
3.4	The broadest scale picture of biological richness, since the beginning of life on Earth.	100
3.5	What caused the sudden initial increase in diversity 540 Myr ago?	105
3.5.1	What could have caused the explosion of animal life after 600 Myr ago?	106
3.5.2	Is the Cambrian Explosion just an effect of better preservation?	107
3.6	How many species have ever existed?	108

3.7	Background extinction	110
3.7.1	The causes of background extinction	110
3.8	Mass extinctions	113
3.9	The main mass extinctions	113
3.10	The end-Permian mass extinction	114
3.11	The end-Cretaceous mass extinction	116
3.12	The end-Ordovician mass extinction	117
3.13	Other mass extinctions	118
3.14	Mass extinctions affected species inhabiting many different environments.	118
3.15	The causes of mass extinctions	119
3.16	Were mass extinctions sudden, or gradual?	119
3.17	The paradigm shift towards acceptance of sudden mass extinctions	121
3.18	There is evidence for dramatic environmental upheaval during mass extinctions	122
3.19	Global collapse of ecosystems is associated with the "Biggest Two" mass extinctions	122
3.20	Death of vegetation	124
3.21	Empty seas	126
3.22	Carbon-12 shifts in the oceans and what they might mean	126
3.23	The Strangelove Ocean	127
3.24	Sudden temperature swings	128
3.25	The aftermath of mass extinctions: disaster taxa	130
3.26	Causes of mass extinctions	131
3.27	Did meteorite impacts bring about mass extinctions? The end-Cretaceous impact	132
3.28	Did a meteorite cause the end-Permian extinction?	136
3.29	Other possible impact events at times of mass extinction	137
3.30	Volcanic eruptions as a cause of mass extinctions	137
3.31	Stagnant, burping oceans as a cause of mass extinctions	139
3.32	The end-Paleocene extinction in the deep sea	142
3.33	Mass extinctions and ice ages	144
3.34	Is there a cycle of mass extinctions?	145
3.35	Diversification and recovery	146
3.36	"Dead clades walking"	147
3.37	The role of luck in the history of life	148
3.38	Beyond the mass extinctions: The story of tropical rainforest diversity	149
3.39	The Quaternary ice ages	152
3.40	The ice ages and diversity in temperate-zone forests	156
3.41	Ice ages may create as well as destroy temperate species	162
3.42	What ice ages did to tropical rainforest diversity	163
4	Hotspots and coldspots	167
4.1	Geographical patchiness in species richness	167

4.2	Hotspots	167
4.3	Some examples of hotspots in species richness.	168
4.3.1	The big lakes of eastern Africa	168
4.3.2	The western Cape of South Africa	170
4.3.3	Lake Baikal in Siberia	171
4.3.4	The mallee scrub of southwestern Australia	172
4.3.5	The western edge of Amazonia	172
4.4	What causes hotspots?	177
4.4.1	The stable environments hypothesis	177
4.4.2	The story of the Cape hotspot.	178
4.4.3	The story of Baikal.	179
4.4.4	The story of the African Rift Valley lakes	180
4.4.5	The story of the southwest Australian mallee	182
4.4.6	The story of the Amazon hotspots	182
4.5	Some conclusions: how important is long-term stability for hotspots?	184
4.6	Peculiarities of local ecology: Are these what it takes to set off a hotspot?	184
4.6.1	What is peculiar about the Cape?	185
4.6.2	What is special about the cichlids in African lakes?	186
4.6.3	What could be peculiar about the western and central Amazonian forest hotspots?	187
4.7	Do hotspots have more room for species, or have they just been given and retained more species?	190
4.8	Coldspots.	190
4.9	Explanations for why diversity coldspots occur	191
4.9.1	Island coldspots	191
4.9.2	Island biogeography on land and in lakes	196
4.9.3	Some experimental tests of MacArthur and Wilson's hypothesis	197
4.10	The peninsula effect	199
4.11	Bursts of speciation on islands	200
4.12	Coldspots made through glacial extinctions.	201
5	The march of Cain: Humans as a destroyer of species	205
5.1	The human species	205
5.2	Humans and the extinction of other humans	206
5.3	The secrets of our success over other human species	210
5.4	Survival of species diversity during the Quaternary	211
5.5	Yet mammals and birds have suffered a great wave of extinctions	214
5.6	Africa, 150,000 years ago	214
5.7	Australia, 45,000 years ago	215
5.8	A second wave of extinction: the Americas and Eurasia	216
5.9	Did climate change cause the extinctions on continents between 45,000 and 10,000 years ago?	218

5.9.1	An Australian drought	219
5.9.2	A thaw, then a freeze	219
5.10	Coincidence of extinctions with human arrival—did the humans do it?	225
5.10.1	When exactly did humans arrive?	225
5.10.2	A “blitzkrieg” on animals in the Americas and Australia?	226
5.10.3	Modeling humans driving Quaternary megafauna extinct	230
5.10.4	Problems in the dating: Did Australian animals really die out just as humans arrived?	233
5.10.5	An explanation for the delay in Europe and the Americas: A “double-whammy” combination of climate change and over-hunting?	234
5.10.6	Smaller animals tended to survive	236
5.10.7	Fire-setting by humans in the Australian extinctions?	237
5.10.8	Or was it a disease? Or meteorites?	238
5.11	The wave of extinction spreads to islands	239
5.11.1	The last mammoths: Wrangel and St. Paul Island	239
5.11.2	Mediterranean islands	240
5.11.3	Madagascar: lemurs and elephant birds	241
5.11.4	Several thousand islands: the story of the Pacific	242
5.11.5	New Zealand and the moas	244
5.11.6	The Hawaiian islands and their birds	245
5.11.7	Mauritius and the dodo	246
5.11.8	St. Helena and its daisy trees	247
5.11.9	Guam and its ground-nesting birds	248
5.12	Why were island species so susceptible to extinction?	249
5.13	Back to the mainland	250
5.13.1	The great auk	251
5.13.2	The passenger pigeon	252
5.13.3	The Carolina parakeet	253
5.13.4	The thylacine	254
5.13.5	Yangtze River dolphin	255
5.13.6	Cichlids in African lakes	255
5.14	Current extinction, seen and unseen	256
6	Knowing what is out there	259
6.1	Nature’s current totals	259
6.2	Identifying new life forms—taxonomy and its challenges	262
6.3	The stages in discovery of a new species	263
6.3.1	Collection	264
6.3.2	Identification	264
6.3.3	Description and naming	265
6.4	The uncertainties in current estimates of species richness	266
6.5	The deep oceans: a big unknown	270
6.6	Other tricks for estimating unknown species richness	271

6.7	A bounty of nematodes?	272
6.8	A plethora of mites?	272
6.9	Estimating the unknown species richness of tropical insects	273
6.10	So, how many types of arthropods are there?	277
6.11	Cryptic diversity	277
6.12	False species diversity: species complexes	279
6.13	The hidden world of microbial diversity	280
6.14	Nature still yields surprises	282
6.15	The shadowy world of cryptozoology	282
6.16	The twilight world of species richness	285
7	The current threats	287
7.1	The greenhouse effect and extinctions	288
7.2	Species ranges changing under global warming	290
7.2.1	Clues from the past	295
7.2.2	Polar environments under global warming	296
7.3	Mountains under climate change	297
7.4	Coral reefs	298
7.5	Global-warming in the longer term	300
7.6	Direct CO ₂ fertilization effects on plants	301
7.7	The "other" direct CO ₂ effect, acidification of the oceans	307
7.8	Introduced species	310
7.8.1	Argentine ants and the fynbos	312
7.9	The amphibian decline	312
7.10	Tree diseases	314
7.11	Habitat clearance	316
8	Holding on to what is left	323
8.1	Conserving habitat	323
8.2	International biosphere reserves and world heritage sites	326
8.3	Uncertainties about species richness: a problem for conservation	327
8.4	Minimum viable population size	328
8.5	Metapopulations: a complication to minimum viable population sizes	333
8.5.1	The shapes and sizes of reserves	333
8.6	How much do nature reserves lose? Relaxation extinction	337
8.7	Active management of reserves	341
8.8	Maintaining reserves in a changeable climate	343
8.9	Aiding plant migration—planting	344
8.10	Taxonomy as the arbiter of fate	346
8.11	Botanic gardens and zoos	347
8.12	Botanic gardens	349
8.13	Seed and embryo banks	351
8.14	<i>In vitro</i> storage of plant genetic material	353

8.15 Rescue through genetic engineering and breeding, against introduced pests and diseases	354
8.16 Back from the dead: Can we regain animals that have already gone extinct?	357
8.17 Warning labels: alerting governments and the public of a species in trouble.	359
8.18 Laws.	360
8.19 Where we stand now	362
