<i>Introduction</i>	v
1. Prelude	1
1.1 Model approaches: from stochastic to deterministic models	1
1.1.1 Survival of one individual	1
1.1.2 Several individuals	6
1.1.3 Many individuals	11
1.1.4 Infinite population size	14
2. Neutral Evolution	17
2.1 Deterministic setting: Hardy–Weinberg model	18
2.2 Finite population size	26
2.2.1 Finite population size: Wright–Fisher	26
2.2.2 Moran model	36
2.2.3 Ecological versus evolutionary time	44
2.2.4 Invasion analysis for the Moran model	48
2.2.5 Coalescence and Ewens’s Sampling Formula in the Moran model	55
2.2.6 Excursion: Hubbell’s unified theory and the ESF .	104
2.3 Neutral evolution on graphs	114
2.3.1 Probability for fixation	114
2.3.2 Identity by descent	119
2.3.3 Island model	125
2.4 Neutral evolution on the lattice: the Voter Model	133
2.4.1 Mathematical toolbox: Particle processes	133
2.4.2 The Voter Model	141

2.5	Diffusion limit	145
2.5.1	Wright-Fisher model: from the time-discrete case to the SDE	145
2.5.2	Moran model — time-continuous case	146
2.5.3	Expected time to fixation	148
2.5.4	Variable population size and site-frequency spectrum	152
2.5.5	Quiescent states: Seedbank model	161
2.5.6	Moran with logistic population dynamics	170
3.	Frequency-Independent Selection	185
3.1	Strong selection	186
3.1.1	Hardy-Weinberg model with selection	186
3.1.2	Strong selection in haploid, finite populations	196
3.2	Weak selection	204
3.2.1	Weak selection and the Moran model	204
3.2.2	Diffusion limit and the SFS	205
3.2.3	Weak selection and seedbanks	212
4.	Frequency-Dependent Selection	217
4.1	Hardy-Weinberg model and sickle-cell anemia	218
4.1.1	The Kermack-McKendrick model	218
4.1.2	Evolutionary host-pathogen interaction in sickle- cell anemia	222
4.2	Game Theory	225
4.2.1	Two player games and Nash equilibria	225
4.2.2	Pareto dominance	229
4.2.3	Cooperation and two-person games	232
4.3	Replicator equation	241
4.3.1	Properties of the replicator equation	243
4.3.2	Cooperative Games	250
4.4	Moran model with frequency-dependent selection	255
4.4.1	Fixation probability for a Markov Chain	255
4.4.2	Cooperation as weak effect	256
4.4.3	Probability for extinction	257
4.5	From the Moran model to the replicator equation	261
4.5.1	Interlude: Diffusion limit for a Markov process	261

4.5.2	Diffusion limit and connection with replicator dynamics	263
5.	Multilevel Evolution and Price Equation	265
5.1	Interlude: Selfish genes, Haldane's idea, and Hamilton's rule	265
5.2	A first look on multilevel evolution	269
5.2.1	Invasion analysis	270
5.2.2	Simpson's paradox and multilevel evolution	271
5.2.3	Interpretation of the relatedness r	272
5.3	Price equation	278
5.3.1	Notation	279
5.3.2	The Price equation	280
5.3.3	Fisher's fundamental theorem of selection	283
5.3.4	Price equation, Prisoner's Dilemma, and Hamilton's rule	284
5.3.5	Multilevel evolution, kin and group selection	288
5.4	Relatedness and games on graphs	294
5.4.1	Game dynamics on a graph	294
5.4.2	Inclusive fitness and relatedness	298
5.4.3	Evolution on graphs — the full fitness approach	305
6.	Adaptive Dynamics	321
6.1	Evolution of virulence	324
6.2	The Prisoner's Dilemma and adaptive dynamics	328
6.2.1	Additive model	329
6.2.2	Local interactions	330
7.	Bacterial Cooperation	335
7.1	Proximate and ultimate cooperation	336
7.1.1	What is social behavior?	336
7.1.2	Basic forms of social interactions	337
7.1.3	Mechanisms improving the stability of cooperation	340
7.2	Division of labour and phenotypic heterogeneity	345
7.2.1	Damage and plasmid segregation	346
7.2.2	Switching environment (no sensing)	354
7.2.3	Switching environment (sensing)	370
7.3	Cooperation and quiescence/persister states	377

7.4	Kin recognition	391
7.4.1	Kin recognition and punishment	391
7.4.2	Quorum sensing, plasticity and bacterial cooperation	394
7.5	Cooperative and altruistic genes in plasmids	401
7.5.1	Plasmids and cooperation in large, homogeneous populations	401
7.5.2	Plasmids also mutate	403
7.5.3	Cooperating plasmids and multilevel evolution	406
7.6	Cooperation as hitchhiker on selfish strategies	417
7.6.1	Colicin A — multilevel setting	418
7.6.2	Colicin B — hitchhiking cooperation	425
7.7	Cooperative behavior between species	434
7.7.1	Mutualism in the homogeneous population	434
7.7.2	Generalized Hamilton's rule	440
7.7.3	Cooperator recognition and punishment	441
7.8	Red Queen and Red King: Time scales in co-evolution	448
7.8.1	Red Queen	448
7.8.2	Red King	452
7.9	Cooperation and evolutionary suicide	460
	<i>Concluding Remarks</i>	469
	Appendix A Mathematical Tools	475
A.1	Some elementary terms from dynamical systems	475
A.1.1	ω -limit sets and Lyapunov functions	477
A.1.2	Long term behavior of linear dynamical systems	478
A.1.3	Singular perturbation theory in a nutshell	484
A.2	Basic stochastic terms	486
A.2.1	Random variables: definitions	486
A.2.2	Random variables: conditional events and more	490
A.2.3	Random variables: important examples	493
A.2.4	Asymptotic behavior, Chebyshev's inequality	498
A.3	Basic facts about stochastic processes	500
A.3.1	Markov Chain	501
A.3.2	Markov Process	504
A.3.3	Poisson Process	509
A.3.4	Stochastic differential equations — a brief primer	510
A.3.5	Stochastic coupling of processes	514

A.4	Martingale stopping theorem	516
A.5	Polya's theorem about random walks	519
A.6	Kakutani's Fixed point theorem	525
Appendix B	Further Notes	533
B.1	The proof of Ewens's Sampling Formula via induction	533
Appendix C	Glossary	537
