PART 1: BASIC PRINCIPLES AND METHODS

1. What is PCR?	1
References	8
2. Instrumentation, Reagents and Consumables	9
Instruments	9
Enzyme choice	12
<i>Taq</i> /Amplitaq® DNA polymerase	14
Vent™ DNA polymerases	15
<i>Pfu</i> DNA polymerase	16
<i>Tth</i> DNA polymerase	16
UITma™ DNA polymerase	17
<i>Pwo</i> DNA polymerase	17
Other PCR reagents	18
Deoxynucleoside triphosphates (dNTPs)	18
Buffers and MgCl ₂	18
Inhibitors and enhancers of PCR	19
Template DNA	21
Primers	23
Primer design	23
Melting temperature (T_m) of primers	24
Primer labeling	25
Calculating primer concentrations	26
Consumables	26
References	27
3. Amplifying the Correct Product	29
Detection and analysis of PCR products	29
Gel electrophoresis	30
Real-time amplicon detection	33
Immunological detection of PCR products	34

Scintillation proximity assay	35
Electrochemiluminescent detection	35
How to avoid contamination	36
Uracil <i>N</i> -glycosylase (uracil DNA glycosylase)	38
UV irradiation	39
Enzymatic treatment	39
Psoralen and isopsoralen treatment	39
Reaction specificity	40
Hot start	40
Antibody-mediated hot-start PCR	42
Touchdown PCR	42
Nested PCR	42
Long-distance PCR (LD-PCR)	43
Key issues in setting up PCR	44
References	45

PART 2: TECHNIQUES AND APPLICATIONS

4. Cloning and Modification of PCR Products	47
Cloning of PCR products	47
The introduction of restriction sites	47
Blunt-end cloning	49
T-A vectors	49
Generation of half-sites	51
Ligation-independent cloning (LIC)	51
UNG cloning	52
pCR-Script™ cloning	53
Modification of PCR products	54
Adding promoters and ribosome-binding sites	55
Joining overlapping PCR products	57
Chimeric genes and gene construction from genomic sequence	57
Synthetic genes	61
References	62
5. Isolation and Construction of DNA Clones	63
PCR from libraries	63
Anchored PCR	64
RACE-PCR	64
Ligation-anchored PCR	67
RNA ligase-mediated RACE	67
RNA (RT) PCR	69
PCR-based cDNA library construction	70

PCR with degenerate primers	72
Differential display PCR	73
References	73
6. PCR Mutagenesis	75
Deletion of sequences	75
Base substitutions	77
Insertion mutagenesis	81
References	84
7. Sequencing PCR Products	85
Direct sequencing	87
Asymmetric PCR	88
Single-stranded DNA sequencing using lambda exonuclease III	91
Cycle sequencing	91
Direct solid-phase sequencing	93
Gene amplification with transcript sequencing (GAWTS)	94
Chemical sequencing	96
PCR archaeology	97
References	98
8. New Sequence Determination and Genome Mapping	101
New sequence by vectorette PCR	101
New sequence by inverse PCR	104
PCR screening and mapping of cosmids, yeast artificial chromosomes (YACs), P1-derived artificial chromosomes (PACs) and bacterial artificial chromosomes (BACs)	104
Chromosomal localization	107
Alu PCR	109
Transgenic animal screening	110
PCR amplification of microdissected DNA	110
References	111
9. Fingerprinting	113
Random amplified polymorphic DNA (RAPD)	113
Amplified fragment length polymorphisms (AFLPs)	115
Microsatellites	116
Variable number tandem repeats (VNTRs)	119
Human leukocyte antigen (HLA) class II typing	119
References	121

10. Characterizing Unknown Mutations	123
Denaturing gradient gel electrophoresis (DGGE)	123
Parallel DGGE	125
Perpendicular DGGE	126
Single-strand conformation polymorphism (SSCP)	126
Chemical cleavage of mismatches	129
References	132
11. Analysis of Known Mutations	133
The amplification refractory mutation system (ARMS)	133
Basic principles	133
ARMS primer design	135
Allele-specific oligonucleotide (ASO) hybridization to immobilized PCR products - dot blots	137
Reverse dot blots	138
RFLP analysis	139
Gene diagnosis using multiplex methods	139
Multiplex PCR analysis in Duchenne muscular dystrophy	140
Multiplex ARMS in cystic fibrosis	140
Other methods	141
Mutation detection by the introduction of restriction sites	141
Competitive oligonucleotide priming (COP)	142
Primer extension sequence test (PEST)	143
Mutation detection using <i>Taq</i> 5' to 3' exonuclease activity	144
PCR amplification of multiple specific alleles (PAMSA)	145
Detecting residual disease after cancer therapy	145
Analysis of single cells for preimplantation diagnosis	146
References	147
12. Detecting Pathogens	149
Fungi	150
Viruses	151
Human retroviruses	151
Other clinically important viruses	153
Bacteria	154
Retrospective analyses using histological specimens	155
Hematoxylin- and eosin-stained sections	156
Formalin-fixed, paraffin-embedded material	156
Exfoliative cytology material	156

<i>In situ</i> PCR	157
References	158

13. Quantitative PCR	161
-----------------------------	------------

DNA	163
RNA	164
References	165

Appendices

A: Glossary	167
B: Suppliers	175
C: Further reading	181
