PART 1: BASIC PRINCIPLES AND METHODS

1. Introduction	1
Historical perspective	1
Advantages of tissue cultures over intact plants	5
2. Equipment and general practise	7
Conditions for media preparation	7
Sterile cabinets or rooms for aseptic transfer	10
Temperature and lighting requirements for growth of cultures	11
3. Aseptic techniques in plant tissue culture	13
Preparation of the laminar flow cabinet	13
Handling pipettes and pipette tips	14
Aseptic transfer of media	14
Aseptic transfer of callus and cell suspensions	15
4. Preparation of plant tissue culture media	19
Composition of media	19
Additions to basic media	23
Preparation and sterilization of media	24
5. Initiation of callus cultures	27
Source of explants for plant cultures	28
Sterilization methods to remove surface contaminants	28
Initiation of callus from explants	31
Presence of endogenous contaminants	34
6. Growth of callus and cell suspension cultures	35
Maintenance of callus cultures	35
Initiation of cell suspension cultures	38

7. Regeneration of tissue cultures	45
Development of somatic embryos	45
Induction of regeneration in tissue cultures	46
Decline in totipotency in tissue cultures	54
Transfer of tissue culture-derived plants to soil	55
Markers for regenerating potential	56

PART 2: APPLICATIONS

8. Haploid cultures	59
Anther culture	61
Ovary and ovule culture	64
Interspecific hybridization using excised embryos	65
Doubling of chromosome numbers	67
Comparison of methods of dihaploid production	68
Genetic variation in dihaploids	69
9. Protoplast cultures	71
Protoplast isolation and culture	72
Methods of protoplast fusion	76
Selection of heterokaryons	79
Contribution of protoplast fusion to crop breeding	80
10. Preservation and cryopreservation of germplasm	83
Reduction in growth rates of cells and tissues	84
Inhibition of growth of cells and tissues by cryopreservation	85
Confirmation of viability and stability of cryopreserved tissues	89
11. Selection for somaclonal variants	91
Source of somaclonal variation	92
Selection for somaclones	95
Progeny testing of somaclones	101
Application of somaclonal variation to crop improvement	101
12. Secondary product synthesis by plant tissue cultures	103
Effect of culture conditions on secondary product synthesis	105
Cell selection <i>in vitro</i> for high yielding cell lines	113

Genetic modification of tissue cultures	115
Large-scale culture of plant cells	117
13. Micropropagation techniques in horticulture and crop improvement	121
Source tissue for micropropagation	123
Methods of micropropagation	124
Problems that arise <i>in vitro</i> during micropropagation	128
Problems that arise <i>in vivo</i> after micropropagation	131
Variation in clonal plants	133
Advantages and disadvantages of micropropagation	134
14. Genetic manipulation of crop plants	139
Strategy for plant transformation through gene transfer	140
Gene manipulation with <i>A.tumefaciens</i>	142
Non-tissue culture based transformation using <i>A.tumefaciens</i>	145
Tissue culture transformation not based on <i>A.tumefaciens</i>	146
Genetically engineered characters in crop plants	148
Appendices	151
Appendix A: Sources and suppliers for chemicals and equipment	151
Appendix B: Further reading	153
Index	155
