<i>Preface</i>	xvii
1. Mathematical Models and the Modeling Cycle	1
1.1 Mathematical Models	1
1.2 The Modeling Cycle	2
1.2.1 Formulation	3
1.2.2 Analysis	3
1.2.3 Validation	3
1.2.4 Improved formulation	4
1.2.5 The cycle	4
1.3 Scientific Issues	4
1.4 Scales of Biological Phenomena	6
1.5 Let's Get Started	7
Part 1. Growth of a Population	9
2 Evolution and Equilibrium	11
2.1 Growth without Immigration	11
2.1.1 Population size dependent growth rates	11
2.1.2 Solution of the model ODE	13
2.1.3 Initial condition and the initial value problem	14
2.2 Exponential Growth	15
2.2.1 Linear growth rate	15
2.2.2 The growth rate constant	16
2.2.3 Model validation	16
2.2.4 Prediction of future population	17
2.3 Estimation of System Parameters	17
2.3.1 The least squares fit	17
2.3.2 The least squares method for exponential growth	18
2.4 A Constant Growth Rate Model	21
2.5 Intravenous Drug Infusion	22

2.5.1	Questions on hypoglycemia	22
2.5.2	Linear models with immigration	22
2.5.3	Mathematical analysis	23
2.5.4	Model improvements	24
2.6	Mosquito Population with Bio-Control	25
2.6.1	The problem of mosquito eradication	25
2.6.2	Constant rate of eradication	26
2.6.3	Seasonal varying growth rate	26
3.	Stability and Bifurcation	27
3.1	The Logistic Growth Model	27
3.1.1	Taylor polynomials for the growth function	27
3.1.2	Normalization and exact solution	29
3.1.3	Implication of the exact solution	29
3.1.4	Validation and model improvement	30
3.2	Critical Points and Their Stability	30
3.2.1	Critical points of autonomous ODE	30
3.2.2	Stability of a critical point	32
3.2.3	Graphical method for critical points and their stability	34
3.2.4	Linear stability analysis	36
3.3	Over-fishing of a Commercial Fish Population	37
3.3.1	Fish harvesting	37
3.3.2	Critical points and their stability	39
3.3.3	Bifurcation for fish harvesting	40
3.4	Bifurcation	41
3.4.1	Bifurcation diagram and horizontal tangency	41
3.4.2	Basic bifurcation types	43
3.5	Structural Stability and Hyperbolic Points	48
Part 2. Interacting Populations		51
4.	Linear Interactions	53
4.1	Types of Interaction	53
4.2	Red Blood Cell Production	54
4.2.1	Model formulation	54
4.2.2	Method of elimination	55
4.2.3	Implication of mathematical results	56
4.3	Linear Systems with Constant Coefficients	58
4.3.1	Vector form	58
4.3.2	Complementary solutions	59
4.3.3	Fundamental matrix solution	59
4.3.4	Matrix diagonalization	63
4.3.5	De-coupling of the linear system	63

4.3.6	The matrix exponential	65
4.3.7	Symmetric matrices	66
4.4	DNA Mutation	68
4.4.1	The double helix	68
4.4.2	Mutation due to base substitutions	69
4.4.3	Linear model	70
4.4.4	Equal opportunity substitution	70
4.5	Defective Matrices	73
4.5.1	A simple example	73
4.5.2	Systematic reduction to Jordan form	75
4.5.3	Matrices with a single eigenvector	75
4.5.4	Multiple but insufficient eigenvectors	77
4.5.5	General defective matrix	79
5.	Nonlinear Autonomous Interactions	81
5.1	Predator-Prey Interaction	81
5.1.1	Rabbits and foxes	81
5.1.2	Reduction of order	82
5.1.3	Critical points	85
5.1.4	Linear stability analysis	86
5.2	Linear Autonomous Systems	87
5.2.1	Critical point and its stability	87
5.2.2	Phase portrait	89
5.2.3	Stability regions	93
5.3	Nonlinear Autonomous Systems	96
5.3.1	Critical points	96
5.3.2	Linear stability analysis	97
5.3.3	Hyperbolic critical points	100
5.4	The Phase Portrait	103
5.4.1	Limit cycles	103
5.4.2	Non-existence of a limit cycle	106
5.4.3	Reversible systems	107
5.4.4	Multiple eigenvalues	109
5.5	Basic Bifurcation Types	110
5.5.1	The bacteria-antibody problem	110
5.5.2	The three basic types of bifurcation	112
5.5.3	Hopf bifurcation	113
6.	HIV Dynamics and Drug Treatments	117
6.1	The Human Immunodeficiency Virus (HIV)	117
6.1.1	HIV is a retrovirus	117
6.1.2	The immune system	117
6.1.3	The virus life cycle	118

6.1.4	Three phases of HIV infection	119
6.1.5	Treatment of HIV	120
6.1.6	The principal direction of HIV research	121
6.2	HIV Dynamics	122
6.2.1	Model formulation	122
6.2.2	Steady states and bifurcation for virus saturation	123
6.2.3	Steady states and bifurcation for a small virus population	126
6.2.4	The three-component model	127
6.3	Drug Treatments	130
6.3.1	The activities of HIV	130
6.3.2	Combining RT and protease inhibitor	131
6.3.3	Effectiveness of AIDS cocktail treatments	133
6.3.4	On the modified three-component model	134
7.	Index Theory, Bistability and Feedback	137
7.1	Poincaré Index for Planar Systems	137
7.2	Bistability — A Dimerized Reaction	140
7.2.1	Interaction involving a dimer	140
7.2.2	Fixed points and bifurcation	141
7.2.3	Linear stability analysis	141
7.3	Bistability — Two Competing Populations	143
7.3.1	Leopards and hyenas	144
7.3.2	Critical points	145
7.3.3	Linear stability analysis	145
7.3.4	Existence of bistability	146
7.3.5	Other bistability configurations?	148
7.3.6	Multiple bifurcation parameters	150
7.4	Cell Lineages and Feedback	151
7.4.1	Multistage cell lineages	151
7.4.2	Performance objectives	153
7.4.3	Feedback control of output	153
7.4.4	A finite steady state	154
7.4.5	Linear stability	155
7.4.6	Fast regeneration time	156
Part 3.	Optimization	159
8	The Economics of Growth	161
8.1	Maximum Sustained Yield	161
8.1.1	Fishing effort and maximum sustainable yield	161
8.1.2	Depensation and other growth rates	163
8.2	Economic Overfishing vs. Biological Overfishing	164
8.2.1	Revenue for a price taker	164

8.2.2	Effort cost and net revenue	165
8.2.3	Economic overfishing vs. biological overfishing	166
8.2.4	Regulatory controls	166
8.3	Discounting the Future	168
8.3.1	Current loss and future payoff	168
8.3.2	Interest and discount rate	169
9.	Optimization over a Planning Period	171
9.1	Calculus of Variations	171
9.1.1	Present value of total profit	171
9.1.2	A problem in the calculus of variations	172
9.1.3	The basic problem	173
9.2	An Illustration of the Solution Process	174
9.2.1	The action of a linear oscillator	174
9.2.2	The condition of stationarity	175
9.2.3	The Euler differential equation	176
9.3	The General Basic Problem	177
9.3.1	The fundamental lemma	177
9.3.2	Euler differential equation for the basic problem	179
9.4	Integration of Special Cases	180
9.4.1	$F(x, y, y') = F(x)$	180
9.4.2	$F(x, y, y') = F(y)$	180
9.4.3	$F(x, y, y') = F(y')$	181
9.4.4	$F(x, y, y') = F(x, y')$	182
9.4.5	$F(x, y, y') = F(y, y')$	183
9.4.6	$F(x, y, y') = F(x, y)$	183
9.5	The Fishery Problem with Catch-Dependent Cost of Harvest	184
9.5.1	The Euler DE and BVP	184
9.5.2	Linear growth rate	184
9.5.3	Constant unit harvest cost ($c_1 = 0$)	185
9.5.4	The method of most rapid approach	187
10.	Modifications of the Basic Problem	191
10.1	Smooth and PWS Extremals	191
10.2	Unspecified Terminal Unknown Value	194
10.2.1	Euler boundary conditions	194
10.2.2	Terminal payoff	196
10.2.3	Euler boundary conditions with terminal payoff	199
10.3	Higher Derivatives and More Unknowns	199
10.3.1	Higher derivatives equivalent to more unknowns	199
10.3.2	Euler differential equations for several unknowns	200
10.3.3	Some examples	201
10.4	Parametric Form and Free End Problems	203

10.4.1	Basic problem in parametric form	203
10.4.2	A first integral and Erdmann's conditions	204
10.4.3	Free end problems	205
11.	Boundary Value Problems are More Complex	209
11.1	Boundary Value Problems and Their Complications	209
11.1.1	Second order equations	209
11.1.2	No solution or too many solutions	210
11.2	One-Dimensional Heat Conduction	211
11.2.1	Rate of change of heat	211
11.2.2	Fourier's law and the heat equation	213
11.2.3	Steady state temperature distributions	214
11.2.4	The time dependent problem	216
11.3	Analytical Solutions for BVP	218
11.3.1	Reduction of order for autonomous equations	218
11.3.2	A nonautonomous nonlinear ODE	220
11.4	The IVP Approach for Linear BVP	221
11.4.1	Homogeneous linear ODE	221
11.4.2	Inhomogeneous ODE	224
11.4.3	Some possible complications	225
11.5	The Shooting Method	225
Part 4.	Constraints and Control	229
12.	"Do Your Best" and the Maximum Principle	231
12.1	The Variational Notation	231
12.1.1	Variations of a function	231
12.1.2	Variations of a function of functions	232
12.1.3	Variations of the performance index	233
12.2	Adjoint Functions	234
12.2.1	A minimum cost problem	234
12.2.2	Constraints on the investment rate	236
12.2.3	The optimal control	237
12.3	With Constraints, Do Your Best	239
12.3.1	The augmented performance index	239
12.3.2	The interior solution	240
12.3.3	Do the best you can	241
12.4	Fishery Problem without Prescribed Terminal Condition	243
12.4.1	The "Do Your Best" approach	243
12.4.2	Interior control is singular	244
12.4.3	Upper corner solution near the end	245
12.4.4	Optimal control for $t < t_s$	246
12.5	Optimal Allocation of Stem Cells for Medical Applications	248

12.6	The Maximum Principle	249
12.6.1	The Hamiltonian	249
12.6.2	The general problem	250
12.6.3	Maximization of the Hamiltonian	251
12.6.4	The stem cell problem	253
12.6.5	The fishery problem with constant unit harvest cost	255
12.6.6	On the Maximum Principle	259
13.	Chlamydia Trachomatis	261
13.1	A Proof of Concept Model of C. Trachomatis	261
13.1.1	Life cycle of Chlamydia Trachomatis	261
13.1.2	A linear growth rate model	261
13.1.3	Hamiltonian and Maximum Principle	263
13.1.4	Biological mechanisms for optimal strategy	265
13.2	Chlamydia with Finite Carrying Capacity	266
13.2.1	The model	266
13.2.2	The singular solutions	268
13.2.3	The upper corner control is optimal adjacent to T	269
13.2.4	Lower corner control optimal only for $R_0 \leq 1/2$	271
13.3	Optimal Conversion Strategy for $R_0 \leq 1/2$	272
13.3.1	The optimal control is bang-bang for $u_{\max} < 1/2$	272
13.3.2	Sub-interval of singular solution possible for $u_{\max} \geq 1/2$	273
13.3.3	On various threshold values	277
13.3.4	Summary for $R_0 \leq 1/2$	279
13.3.5	Case I — $0 < R_0 \leq R_c$	280
13.3.6	Case II — $R_c < R_0 < 1/2$	280
13.4	Optimal Conversion Strategy for $R_0 > 1/2$	280
13.4.1	Upper corner control for $1 - u_{\max} \geq R_0$ ($> 1/2$)	280
13.4.2	Optimal conversion strategies for $1 - u_{\max} < R_0$	282
13.4.3	The relative magnitude of t_x and t_S	285
13.4.4	Summary of the optimal conversion strategy for $R_0 > 1/2$	288
13.4.5	Case III — $u_{\max} \leq 1/2$	288
13.4.6	Case IV — $u_{\max} > 1/2$	288
13.5	Mathematics and the Biology of Chlamydia	288
14.	Genetic Instability and Carcinogenesis	293
14.1	Genetic Instability is a Two-Edge Sword	293
14.2	Activation of an Oncogene	295
14.2.1	A one-step system	295
14.2.2	Dependence of death rate on mutation rate	296
14.2.3	Dimensionless formulation	297
14.3	Shortest Time by a Constant Mutation Rate	298
14.3.1	An alternative description of the evolving populations	298

14.3.2	Numerical solution for a time-invariant control	299
14.4	The TOP	301
14.4.1	Fastest time to cancer	301
14.4.2	The Maximum Principle	302
14.4.3	Some preliminary results on adjoint functions	304
14.4.4	Vanishing Hamiltonian for our TOP	306
14.5	Strictly Concave Death Rates	306
14.5.1	Upper corner control near the start	306
14.5.2	Optimal mutation rate is bang-bang	308
14.5.3	General strictly concave death rate	310
14.6	Optimal Switch Point for Bang-Bang Mutation	310
14.6.1	A brute force scheme on $x_s = x_2(T_s)$	310
14.6.2	Some bounds for the optimal switch time	311
14.7	Other Types of Death Rates	314
14.7.1	A death rate linear in mutation rate	314
14.7.2	Strictly convex death rate	314
15.	Mathematical Modeling Revisited	315
15.1	From Simple to Complex	315
15.1.1	Simple question	315
15.1.2	Simple model and upgrading	316
15.1.3	Instantaneous rate of change	317
15.2	Open to Options	318
15.2.1	Higher order rates of change?	318
15.2.2	Mathematical effectiveness & computational efficiency	319
15.3	Improvement or Alternative	321
15.3.1	Weighted parameter estimation	321
15.3.2	Rate limiting carrying capacity	322
15.4	Active Modeling Experience	323
Appendix A	First Order ODE	325
A.1	Separable ODE	325
A.1.1	Reduction to a calculus problem	325
A.1.2	Initial condition and the initial value problem	326
A.1.3	Scale invariant first order ODE	327
A.2	First Order Linear ODE	328
A.2.1	Integrating factor	328
A.2.2	The Bernoulli equation	329
A.3	An Exact First Order ODE	330
A.3.1	Test for an exact equation	330
A.3.2	Reduction to a calculus problem	331
A.4	When an ODE Is Not Exact	333
A.5	Summary of Methods for First Order ODE	334

Appendix B Basic Numerical Methods	335
B.1 Simple Euler	335
B.2 Slowly	336
B.3 But Not So Surely	338
B.4 No Clue	341
B.5 Clueless?	343
B.6 Well-Posed Problems	346
B.7 Higher Order Numerical Schemes for IVP	348
Appendix C Assignments	351
C.1 Assignment I	351
C.2 Assignment II	352
C.3 Assignment III	354
C.4 Assignment IV	356
C.5 Assignment V	358
C.6 A Typical Midterm Examination	359
C.7 Assignment VI	360
C.8 Assignment VII	362
C.9 Assignment VIII	363
C.10 A Typical Final Examination	365
Bibliography	369
Index	371
