Preface	xi
Mathematics in the biological sciences	xi
How we have used this book	xii
Students as researchers	xiii
Some details about the book	xiv
Conclusion	xv
Part 1. Background	1
Chapter 1. Lake Victoria	3
1.1. Humans around Lake Victoria	3
1.2. Challenges facing Lake Victoria	4
1.3. Our small contribution	7
Bibliography	7
Chapter 2. What is Calculus?	9
2.1. Biological context	9
2.2. Rates of change	9
2.3. The derivative at a point	11
2.4. The derivative as a function	12
2.5. Antiderivatives	13
2.6. Fitting a tumor growth model to data	15
2.7. Conclusion	16
Bibliography	17
Part 2. Population modeling	19
Chapter 3. Introduction to Population Modeling	21
3.1. Biological context	22
3.2. The model	22
3.3. Implications	27
3.4. Analysis of the model	28
3.5. Differential equation terminology	29
3.6. Dimensional analysis and models	31
3.7. Problems	31
Bibliography	32
Chapter 4. Logistic Growth	35
4.1. Biological context	36
4.2. The model	37

4.3. Analysis of the model	38
4.4. Model versus real world data	45
4.5. Implications of the model	46
4.6. Problems	46
Bibliography	50
Chapter 5. Harvesting a Population with Logistic Growth	51
5.1. Biological context	51
5.2. The model	53
5.3. Analysis of the model	55
5.4. Implications of the model	56
5.5. Problems	57
Bibliography	58
Chapter 6. Euler's Method	59
6.1. The method	59
6.2. Problems	61
Bibliography	62
Chapter 7. Modeling Interlude: The Modeling Process	63
7.1. Added value	63
7.2. A list of questions for a model-designer to consider	64
7.3. Approach in this book	65
7.4. The biological models in this book	66
Chapter 8. Research Interlude: Reading a Research Paper	69
8.1. Finding existing models of something	69
8.2. Close reading	71
8.3. Finding parameter estimates for your model	72
Chapter 9. Brief Introduction to Sage	75
9.1. Try it out!	75
9.2. Getting Sage	76
9.3. Solving and plotting differential equations in Sage	77
9.4. Basic Sage programing	77
Bibliography	79
Chapter 10. Projects for Population Modeling	81
Bibliography	84
Part 3. Drug modeling	85
Chapter 11. Introduction to Pharmacokinetics	87
11.1. Biological context	87
11.2. The model	89
11.3. Half-life	91
11.4. Implications of the model	92
11.5. One compartment IV administration: Pharmacokinetic details	93
11.6. Problems	95
Bibliography	96

Chapter 12. Two Models for Lead in the Body	97
12.1. Medical context	97
12.2. The first model	98
12.3. The second model	103
12.4. Implications	104
12.5. Problems	104
Bibliography	105
Chapter 13. Methods of Drug Administration	107
13.1. Biological context	108
13.2. Multi-compartment pharmacokinetic models	108
13.3. Method of residuals	111
13.4. The model for halofantrine	112
13.5. Problems	115
Bibliography	116
Chapter 14. Euler's Method for Systems of Differential Equations	117
14.1. Vector notation	118
14.2. Existence and uniqueness	121
14.3. Problems	121
Bibliography	122
Chapter 15. Modeling Interlude: Sensitivity Analysis	123
15.1. Notation	123
15.2. The basic question and a basic solution	124
15.3. An example	125
15.4. Problems	127
Chapter 16. Research Interlude: Writing a Research Paper	129
16.1. Components of a scientific paper	129
16.2. Putting pen to paper (or fingers to keyboard)	131
Bibliography	132
Chapter 17. Projects for Pharmacokinetic Modeling	133
17.1. Projects	133
Bibliography	135
Part 4. Predator prey modeling	137
Chapter 18. Undamped Lotka-Volterra Equations	139
18.1. Biological context	140
18.2. The model	143
18.3. Analysis of the model	145
18.4. Implications of the model	150
18.5. Plotting phase portraits in Sage	153
18.6. Problems	156
Bibliography	157
Chapter 19. Damped Lotka-Volterra Equations	159
19.1. Biological context	159
19.2. The model	160

19.3. Analysis of the model	161
19.4. Problems	165
Chapter 20. Predator Satiation	167
20.1. Biological context	167
20.2. The model	170
20.3. Problems	173
Chapter 21. Isoclines	175
21.1. Biological context	175
21.2. Problems	181
Chapter 22. Species Formation	183
22.1. Problems	187
Chapter 23. Top Predators	189
23.1. Biological context	189
23.2. The model	189
23.3. Analysis of the model	190
23.4. An example from the literature	194
23.5. Problems	197
Bibliography	197
Chapter 24. Modeling Interlude: Potential Problems with Models	199
24.1. Models can't do everything	199
24.2. Models can be misapplied	200
24.3. Models can be unverified	200
24.4. Models can be poorly calibrated	200
24.5. Models cannot be validated	200
24.6. Models are still valuable	201
Bibliography	201
Chapter 25. Research Interlude: Making Figures	203
25.1. Terminology	203
25.2. How to tell if your figure or table is complete	203
25.3. Parting advice	204
Bibliography	205
Chapter 26. Projects for Predatory-Prey Models	207
26.1. Biological context	207
26.2. The model	210
26.3. Projects	214
Bibliography	216
Part 5. Infectious disease modeling	217
Chapter 27. SIR Model for Infectious Diseases	219
27.1. Biological context	219
27.2. The model	220
27.3. Analysis of the model	221
27.4. Implications of the model	223

27.5. Problems	224
Bibliography	224
Chapter 28. Malaria	227
28.1. Biological context	228
28.2. The model	229
28.3. Implications of the model	231
28.4. Problems	232
Bibliography	233
Chapter 29. HIV/AIDS	235
29.1. Biological context	235
29.2. The model	236
29.3. Implications of the model	237
29.4. Problems	238
Bibliography	238
Chapter 30. Projects for Infectious Disease Models	241
Bibliography	242
Chapter 31. Classroom Tested Projects	243
31.1. Population modeling	243
31.2. Drug modeling	243
31.3. Predator-Prey modeling	246
31.4. Infectious disease modeling	247
Index	251
