|-----------------------------------------------------------------------|-------------|
| <i>Preface</i>                                                        | <i>ix</i>   |
| <i>Acknowledgements</i>                                               | <i>xiii</i> |
| <i>About the Authors</i>                                              | <i>xv</i>   |
| <b>Chapter 1: Introduction</b>                                        | <b>1</b>    |
| 1.1 Why Study Photosynthesis?                                         | 1           |
| 1.2 History                                                           | 2           |
| 1.2.1 The discovery of photosynthesis                                 | 2           |
| 1.2.2 The concept of energy                                           | 5           |
| 1.2.3 Early research on photosynthesis                                | 7           |
| 1.2.3.1 What absorbs the light for photosynthesis?                    | 7           |
| 1.2.3.2 What goes in, and what comes out?                             | 8           |
| 1.2.3.3 Which atoms go where? Is it possible to answer this question? | 10          |
| 1.2.3.4 How much light is required to drive photosynthesis?           | 13          |
| References                                                            | 14          |
| <b>Chapter 2: The Photosynthetic Apparatus</b>                        | <b>17</b>   |
| 2.1 Introduction                                                      | 17          |
| 2.2 Chloroplasts                                                      | 17          |
| 2.3 Thylakoid Membrane and Photosynthetic Protein Complexes           | 20          |
| 2.4 Pigments                                                          | 23          |
| 2.5 Lipids and Proteins                                               | 23          |
| 2.6 Evolution                                                         | 26          |
| References                                                            | 26          |
| <b>Chapter 3: Basics of Photosynthesis: Light-Dependent Reactions</b> | <b>29</b>   |
| 3.1 Overview: Harvesting Sunlight to Drive Redox Chemistry            | 29          |
| 3.2 Capturing the Energy of Light                                     | 29          |
| 3.3 Conversion of Light Energy into Chemical Energy                   | 36          |

|                                                                  |                                                                           |    |
|------------------------------------------------------------------|---------------------------------------------------------------------------|----|
| 3.3.1                                                            | Primary photochemistry                                                    | 36 |
| 3.3.2                                                            | Electron-transfer pathways                                                | 41 |
| 3.3.2.1                                                          | The "Z-scheme" of photosynthesis                                          | 41 |
| 3.3.2.2                                                          | Photosynthetic water oxidation<br>(oxygen evolution)                      | 43 |
| 3.3.2.3                                                          | Unique role of bicarbonate in light-induced<br>reactions of PSII          | 44 |
| 3.3.2.4                                                          | Formation of reducing power                                               | 45 |
| 3.3.3                                                            | Proton-transfer pathways and formation<br>of ATP (photophosphorylation)   | 46 |
| References                                                       |                                                                           | 51 |
| <b>Chapter 4: Basics of Photosynthesis: The Carbon Reactions</b> |                                                                           | 59 |
| 4.1                                                              | C <sub>3</sub> Photosynthesis: The Calvin-Benson Cycle                    | 59 |
| 4.2                                                              | C <sub>4</sub> Photosynthesis: The Hatch-Slack Pathway                    | 63 |
| 4.3                                                              | Crassulacean Acid Metabolism                                              | 69 |
| 4.4                                                              | Translocation and Biomass Production                                      | 71 |
| 4.5                                                              | Alternate Pathways and Evolution                                          | 74 |
| References                                                       |                                                                           | 75 |
| <b>Chapter 5: Regulation of Photosynthesis</b>                   |                                                                           | 81 |
| 5.1                                                              | Background                                                                | 81 |
| 5.2                                                              | State Transitions                                                         | 82 |
| 5.3                                                              | Safety Valve: Dissipation of Electronic Energy<br>as Heat ("Quenching")   | 86 |
| 5.4                                                              | Xanthophyll Cycles                                                        | 87 |
| 5.5                                                              | Reaction Centers as Sinks for Excess<br>Excitation Energy                 | 90 |
| 5.6                                                              | Quenching of Chlorophyll Triplets                                         | 93 |
| 5.7                                                              | Regulation of RuBisCO                                                     | 94 |
| 5.8                                                              | Redox Regulation of Certain Calvin-Benson<br>Cycle Enzymes by Thioredoxin | 95 |
| 5.9                                                              | Other Regulatory Mechanisms Related<br>to Photosynthesis                  | 96 |

|                                                                                                            |     |
