

ACKNOWLEDGEMENTS

The stories in this book are based on the published scientific work of many extraordinary scientists. I have not associated their names with the discoveries chronicled in this book. According to contemporary publishing habits in biology, the name of the senior person in the laboratory is usually last in the list of authors. Often, the work is, nevertheless, identified by and credited to that person's name. Forgotten in this method are the several students and postdoctoral fellows who actually did the laboratory and greenhouse work under the direction and inspiration of the senior scientist. That senior is also responsible for obtaining the financial resources required for the work. I am indebted to the published scientific papers of all these scientists for teaching me about flowering and making it possible to share their stories with readers.

Elliot Meyerowitz at Caltech is a leading plant biologist whose work has had a major influence on scientific descriptions of flowering. His generosity with ideas and clarifications has been a great help to me as I educated myself into the marvelous stories about blossoming. I am very grateful for his advice; it helped me clarify some complex mechanisms. I thank Laura Youman Debole for the lovely line drawings that grace this book.

I also thank my colleague Susanne Garvey at the Carnegie Institution for Science for reading the whole manuscript and providing suggestions. She is one of those rare humanists who knows how to read science.

ACKNOWLEDGEMENTS

Any errors that remain in the text are my own doing.

Finally, I thank my friend of many decades, Naomi Felsenfeld, for being a great companion as a knowledgeable wild flower hunter. She does insist on one very helpful caution, namely, not to bother trying to identify the many small, daisy like flowers. She says the same thing about small brown birds...but birds are her thing, not mine.
