This book covers the latest development in the biotechnological application of extremophiles. Along with this the impact of climate change and environmental pollution on loss of diversity of extremophiles is also discussed. This is crucial as the loss of this diversity is related with the loss of many bioactive compounds and bacteria of ecological importance. This volume outlines applications of extremophiles in biotechnology, nanotechnology, and bioremediation.

THE SERIES: SUSTAINABLE WATER AND WASTEWATER TREATMENT

This series discusses the recent advances in water and wastewater treatment research and processes covering bio-remediation, bio-degradation, molecular approaches and electro-biochemical strategies. It also evaluates the possible applications of these corrective strategies to remove toxic pollutants from the environment. The series describes the limitations and challenges of wastewater treatments. In addition, it covers various advanced and innovative technologies to remove toxic and hazardous pollutants present in wastewater in a sustainable manner. Moreover, it considers the application of mathematical modelling and different emerging molecular tools to wastewater treatment. Particular attention is given to water reuse and recovery of added-value products from wastewater since it would contribute to a circular and bio-based economy.

Please send any book proposals to Maulin P. Shah (Enviro Technology Ltd., India), Editor-in-Chief.
