The Effects of Fishing on Marine Ecosystems

S Jennings and M J Kaiser

**A Biogeographical Perspective of the Deep-Sea
Hydrothermal Vent Fauna**

V Tunnicliffe, A G McArthur and D McHugh

Cover illustration: Two-spot snappers *Lutjanus biguttatus* shoaling on a patch reef in a traditional Fijian fishing ground. Large, diurnally active and reef associated fishes such as these are the favoured targets of many reef fishers and decreases in their abundance are amongst the most readily detectable effects of fishing when reefs are fished for the first time. See 'The effects of fishing on marine ecosystems' by S Jennings and M J Kaiser (p. 203). Photograph courtesy of Simon Jennings.
