Protein-Protein Interactions in Human Disease, Part A

VOLUME 110

Edited by
Rossen Donev

This volume describes multidisciplinary approaches in applying cutting edge techniques in detection and analysis of protein-protein interactions. The application of these techniques in identifying molecular mechanisms underlying different human diseases and disorders as well as in the design of new therapeutic strategies targeting these mechanisms are described in-depth. Hence, we hope that articles in this volume would inspire new ideas in researchers and specialists from a wide number of fields such as protein chemists, pharmacologists, cell biologists, biomedical researchers, immunologists, structural biologists, computational biochemists and other researchers working in this field. This volume is also intended as a scholarly material for use by students with interest in the above topics.

Cover image: The ubiquitin-proteasome pathway (for further details, please read Gaczynska and Omulski published in this volume).
