

Primate Sexuality provides an authoritative and comprehensive synthesis of current research on the evolution and physiological control of sexual behaviour in the primates—prosimians, monkeys, apes, and human beings. This new edition has been fully updated and greatly expanded throughout to incorporate a decade of new research findings. It maintains the depth and scientific rigour of the first edition, and includes a new chapter on human sexuality, written from a comparative perspective. With 2,600 references, almost 400 figures and photographs, and 73 tables, *Primate Sexuality* is an essential reference work for students and researchers in the fields of primatology, anthropology, evolutionary biology, and psychology, as well as psychiatrists and clinicians with an interest in human reproduction, sexuality, and evolution.

Alan F. Dixson is Professor in the School of Biological Sciences at Victoria University of Wellington, New Zealand. His knowledge and experience, based on forty years of laboratory work and field research on primate reproductive biology, is unique.
