

Laboratory Exercises and Techniques in Cellular Biology

Anthony Contento

Written for Cell Biology and Molecular Biology Students!

Contento focuses on the exercises and techniques students need to make the connection to key concepts covered in the Cell or Molecular Biology course. The manual consists of 30+ experiments which coincide and complement each of the 18 chapters in the Karp—*Cell and Molecular Biology* text. There are three possible designs of the lab book focusing on Techniques, Concepts, or Organelles. Contento presents very clear and effective procedures which remain standard and unchanged in all designs of the lab book. Each lab contains special overview pages, discussion questions and datasheets bringing a real, scientific lab experience to your students and giving instructors the flexibility to create a lab book that suits their lecture course curriculum and available equipment or supplies.
