

"If you want to understand how the natural world works, you need to know about insects – the most important multi-cellular organisms on our planet. The key to that understanding is now in your hands. Authoritative yet accessible, this is the clearest and most comprehensive guide ever written on the workings of insects."

George McGavin, Honorary Research Associate, University Museum of Natural History and Department of Zoology, Oxford University

"This new edition fascinates the reader with details on the morphology, processes and mechanisms which allow insects to burgeon on Earth. The tradition of excellence established by Chapman has been perpetuated. Thoroughly modernized and comprehensive, the revision captures the excitement of recent major advances in understanding."

Peter W. Price, Regents' Professor Emeritus, Department of Biological Sciences, Northern Arizona University, Flagstaff

- Revised and expanded by a team of eminent insect physiologists, bringing it fully up to date for the molecular era
- A new prologue by George McGavin introduces groups of insects, making it easy for students with little knowledge of taxonomy to navigate the book
- New end-of-chapter summaries allow students to recap on the key points from each chapter and recommended reading sections provide a lead-in to the primary literature
- Richly illustrated throughout with nearly 600 figures

Cover illustration: a nymph of *Locusta migratoria* feeding on seedling wheat. Image by Dr Gabriel A. Miller.
