

- **Advanced Immunology** is designed for people who already have a knowledge of basic immunology and want to understand the processes involved in immune reactions in greater depth.

While retaining the distinctive style and broad coverage of previous editions, this completely rewritten third edition focuses on the most active research areas and latest developments in immunology. From adhesion molecules in inflammation and MHC class II structure, to positive and negative thymic selection and molecular details of MHC-peptide binding, this new edition of *Advanced Immunology* brings the subject right up to date. In addition, there is a wealth of new information on T cell repertoire, new cytokines and chemokines, and a completely new chapter on therapeutic intervention.

- **Features include**

- Reorganization of sections on development of the immune response
- Over 215 color diagrams and tables
- Tables of CD nomenclature and cytokines
- New chapter on therapeutic intervention

This third edition of *Advanced Immunology* will be indispensable to students of immunology and researchers, providing the level of detail needed at an affordable price.
