

"... a marvellous book. [Noble] sets the relativity of biology in a remarkable scientific sweep, ranging from cosmology to human belief systems."

Sir Patrick Bateson, *University of Cambridge, UK*

"In this elegantly written and personal book world-renowned physiologist and systems biologist Denis Noble effectively argues for a fundamental revision of the theory of evolution. Against the reductionist, gene-centered approach of Neo-Darwinism, which has dominated biology for more than a century, Noble passionately pleads for a more integrated approach."

Jos de Mul, *Erasmus University Rotterdam, Netherlands*

"Denis Noble [provides] a completely new view of life."

Yung E Earm, *Seoul National University, South Korea*

"This engaging book ... provides strong support for an extended synthesis of evolutionary theory that goes beyond the Modern Synthesis of Neo-Darwinism ... highly recommended as a thoughtful study of the kind of complexity real living organisms display."

George Ellis, *University of Cape Town, South Africa*

"... a 'must read'. [Noble] lucidly deconstructs how and why reductionism came to prominence in biology and led to the current state of molecular Humpty-Dumptyism. His central idea that there is no privileged level of causation is the first conceptual step to putting Humpty Dumpty back together again."

Michael J. Joyner, *Mayo Clinic, USA*

"... this remarkable book deserves to become a classic text in the philosophy of science."

Sir Anthony Kenny, *University of Oxford, UK*

"... one of the most fascinating and impressive books I have ever read."

Yoshihisa Kurachi, *Osaka University, Japan*

"... shows elegantly and brilliantly that from the miracle of the ancient symbiosis of mitochondrial bacterial remnants in human cells, through the rock-solid interrelationship between genes and the feedback from the environment in all senses--from the core phenomenon of functional epigenetics, to the universe itself and our place in it--that we are, at heart, inter-beings, co-arising."

Samuel Shem, *New York University, USA*
