

Bird Conservation is the second volume in the series *Synopses of Conservation Evidence* and linked to the online resource www.conservationevidence.com. *Bee Conservation* has already been published and *Farmland Conservation* will be out soon. Other volumes will follow.

The series is part of an on-going effort to make biodiversity conservation more evidence-based.

This book brings together scientific evidence and experience relevant to the practical conservation of wild birds.

The authors worked with an international group of bird experts and conservationists to develop a global list of 322 interventions that could benefit wild birds.

For each intervention, the book summarises studies captured by the Conservation Evidence project, where that intervention has been tested and its effects on birds quantified. The result is a thorough guide to what is known, or not known, about the effectiveness of bird conservation actions throughout the world.

The preparation of this synopsis was funded by the Natural Environment Research Council and Arcadia.
