Introduction	1
1 Brief history of a concept: why be concerned by biological diversity?	5
1.1 What does 'biodiversity' refer to?	6
1.2 The origins of the convention on biological diversity and what is at stake	8
1.2.1 The 'conservationists'	9
1.2.2 'Useful nature'	10
1.2.3 Nature has its price	10
1.3 What is changing?	11
2 Biological diversity: what do we know?	13
2.1 The classification of living organisms – underlying principles	13
2.1.1 Levels of organization in the living world	13
2.1.2 Taxonomic hierarchies: the search for an evolutionary and functional order in the diversity of species	15
2.1.3 The concept of species	18
2.1.4 Ecosystems	20
2.2 The inventory of species	22
2.3 Systematics, computer technology and the internet	24
2.4 Measuring biological diversity	26
2.5 The geographic distribution of biological diversity	27
2.5.1 The taxonomic diversity of marine environments is greater than that of terrestrial environments	29
2.5.2 Gradients of spatial distribution	30
2.5.3 The relationship between surface area and species richness	33
2.5.4 Biomes as ecological units	34

2.5.5 Biogeographic regions as taxonomic units	35
2.5.6 'Hotspots': areas of high diversity	36
3 The mechanisms at work in the diversification of life	39
3.1 What is life?	40
3.1.1 The chemistry of the origins of life	40
3.1.2 How did life appear upon Earth?	40
3.2 Origins and dynamics of intra- and interspecific genetic diversity	43
3.2.1 Genetic diversity and the universality of life	43
3.2.2 Mutation	44
3.2.3 Variation and stability	46
3.2.4 Hidden genetic diversity and phenotypic identity	46
3.2.5 Spatial organization and dynamics of intraspecific genetic diversity	47
3.3 How are species born?	49
3.3.1 Mechanisms of speciation	49
3.3.2 Modes of speciation	49
3.3.3 Gradualism and/or punctuated equilibriums	50
3.4 Extinctions	51
3.5 Adaptation: a fundamental property of living organisms	54
3.5.1 Genetic diversity and adaptation of eukaryotes to environmental changes	55
3.5.2 The adaptive capacity of prokaryotes	57
3.6 Major stages in the diversification of the living world	60
3.6.1 The main lines of evolution and how they are related	60
3.6.2 From unicellular to multicellular organisms	62
3.6.3 The explosion of biological diversity in the Cambrian period	62
3.6.4 From the sea to the land: a successful transition	63
3.6.5 The long history of vertebrates	66
3.7 Is the evolution of life predetermined?	69
4 The species richness of natural communities as a result of equilibrium/non-equilibrium processes	73
4.1 Theories of equilibrium based on interspecific relationships	74
4.1.1 Theories of equilibrium as a result of interspecific competition	74
4.1.2 The role of predation	75
4.1.3 Mutualism or co-operative relationships between species	76

4.1.4 Saturation of communities and biotic interactions	77
4.1.5 The Macarthur-Wilson model and the theory of dynamic equilibrium	79
4.2 Theories of succession	81
4.2.1 Succession	82
4.2.2 The concept of climax	84
4.2.3 The Holling model	84
4.3 The dynamic equilibrium of ecosystems and the role of disturbances	85
4.3.1 What is a disturbance?	87
4.3.2 The intermediate disturbance hypothesis	87
4.3.3 Buffering and recuperative capacities of ecosystems	89
4.4 Spatial heterogeneity and temporal variability	90
4.4.1 Fragmented communities	90
4.4.2 The dynamics of non-equilibrium	91
4.4.3 Patch dynamics	92
4.4.4 From the continental to the local level: a conceptual model to explain the richness of ichthyic communities	93
4.5 Are ecological communities governed by niche- assembly or dispersal-assembly rules?	95
5 Biological diversity and the functioning of ecological systems	97
5.1 Biological diversity: a dynamic system	97
5.2 The ecosystem approach	99
5.3 Functions of species within ecosystems	100
5.3.1 Keystone species	101
5.3.2 Engineer organisms	101
5.3.3 Functional groups: complementarity and redundancy	102
5.4 Hypotheses on the role of species in ecosystem functioning	103
5.5 Neighbourhood relationships between species	105
5.5.1 Competition	105
5.5.2 Co-operative relationships: commensalism and symbiosis	105
5.5.3 Parasitism	106
5.6 Food webs and trophic chains	109
5.6.1 Producers-consumers-decomposers: the flow of matter and energy	109
5.6.2 'Top-down' and 'bottom-up' theories	111
5.6.3 Theory of trophic cascades	112
5.7 The diversity of species and biological production	113
5.8 Biological diversity and the 'stability' of ecosystems	115

5.9	The role of biological diversity in biochemical cycles	116
5.9.1	The biological fixation of nitrogen	117
5.9.2	The mineralization of organic matter	117
5.9.3	Long-term storage of mineral elements	118
5.9.4	Recycling and transport of nutrients by consumers	119
5.10	The role of biological communities	120
5.10.1	The importance of micro-organisms for the structure and functioning of pelagic trophic networks in aquatic environments	120
5.10.2	Riparian vegetation and the functioning of rivers	122
5.10.3	The role of soil communities	123
5.11	Biological diversity and the dynamics of the biosphere	125
5.11.1	Composition of the atmosphere	125
5.11.2	Control of evapotranspiration in the soil-plant-atmosphere system	126
5.12	The cybernetic cohesion of ecosystems: the role of communication networks	127
5.12.1	Communication by chemical substances in aquatic systems	128
6	The dynamics of biological diversity and the consequences of human activities	131
6.1	Paleoenvironments and biological diversity	132
6.1.1	Northern European terrestrial systems	133
6.1.2	Tropical rainforests	136
6.1.3	Continental aquatic systems	143
6.2	Humankind and the erosion of biological diversity	144
6.2.1	The myth of the noble savage	144
6.2.2	The extinction of large mammals at the end of the Pleistocene: were humans the cause?	146
6.2.3	The current erosion of biological diversity	147
6.3	Human activities and the dynamics of biological diversity	150
6.3.1	Demographic pressures	152
6.3.2	Land use and the transformation of the countryside	152
6.3.3	Biological invasions and the introduction of species	154
6.3.4	Overexploitation	159
6.3.5	Some examples illustrating the combined effect of human activities on the dynamics of biological diversity	161

7 The dynamics of biological diversity and implications for human health	165
7.1 The complexity of host-parasite relationships	165
7.1.1 Human onchocerciasis	166
7.1.2 Malaria	167
7.2 Emerging pathologies	168
7.3 Environmental change, biological diversity and human health	170
7.3.1 Intercontinental exchanges	170
7.3.2 New technologies related to lifestyle	171
7.3.3 The eutrophication of water and the proliferation of toxic algae	172
7.3.4 Allergies	173
7.4 The growing virulence of viral diseases	174
7.4.1 Morbilliviruses	177
7.4.2 Haemorrhagic fever viruses	177
7.5 Adaptive strategies of pathogenic agents and their vectors	179
7.5.1 Resistance to antibiotics	179
7.5.2 Resistance to pesticides	180
7.6 Substances of medical interest and biological diversity	182
7.6.1 Traditional pharmacology	182
7.6.2 Biological diversity and the pharmaceutical industry	183
8 Genetic resources and biotechnology	185
8.1 The domestication of nature: an old story	185
8.2 Genetic diversity and domestication: creating and selecting 'useful' species	188
8.3 The management and diversity of genetic resources	191
8.4 The biotechnological revolution and genetically modified organisms	196
8.4.1 Transgenesis	197
8.4.2 Applications in agriculture	198
8.4.3 Anticipating the risks of genetically modified organisms	200
8.5 Property rights and the commercialization of living things	202
8.5.1 The international involvement of the FAO	203
8.5.2 The Plant Variety Protection (PVP) Certificate	204
8.5.3 The Convention on Biological Diversity	204
8.6 Patents on life: an open debate	205

9 'Useful' nature: the value and use of biological diversity	207
9.1 Benefits and services provided by ecosystems	208
9.2 Theoretical bases for assessing the economic value of biological diversity	209
9.2.1 Use value and non-use value	210
9.2.2 Economic goods versus free goods	211
9.2.3 Appropriation and/or free access to biological diversity	212
9.3 Putting a price on biological diversity	213
9.3.1 What is the overall value of ecosystems?	214
9.3.2 'Natural infrastructures'	215
9.4 Uses for biological diversity	216
9.4.1 Use of living resources for food	216
9.4.2 Extractive products	217
9.4.3 Timber	219
9.4.4 Biotechnology and industrial applications	219
9.4.5 Ornamental plants and animals	222
9.4.6 Ecotourism	222
10 The conservation of biodiversity	225
10.1 Why protect biological diversity?	227
10.2 Approaches to conservation	229
10.2.1 <i>In situ</i> and <i>ex situ</i> conservation	229
10.2.2 Species <i>versus</i> ecosystem conservation	230
10.2.3 What are the priorities for conservation?	231
10.2.4 What about the cost?	233
10.3 Protected areas	235
10.3.1 National parks: nature <i>versus</i> humans	235
10.3.2 Integrating Nature and humans	236
10.3.3 Europe and biodiversity: Natura 2000	238
10.4 Sustainable use of biological diversity	239
10.4.1 Sustainable development	239
10.4.2 Traditional knowledge	241
10.4.3 Regional planning and development	242
10.4.4 Marine environments: how can the perpetuation of fisheries be reconciled with the conservation of marine resources?	242
10.5 <i>Ex situ</i> conservation	245
10.5.1 Botanic gardens	246
10.5.2 Zoological parks	248

10.6	Conservation biology	249
10.6.1	The fragmentation of habitats	250
10.6.2	Reintroduction of species	251
10.6.3	Restoration ecology	251
10.7	The preventive approach: ecosystem health checks	253
10.7.1	Ecosystem health and/or integrity	254
10.7.2	Bio-indicators	255
10.8	Disturbances: allies of conservation?	256
10.8.1	Fire	256
10.8.2	Cyclones and storms	258
10.9	International Conventions	259
10.10	From theory to practice: some examples for the implementation of the principles of conservation and sustainable development, and the difficulties encountered	260
10.10.1	Implementing international conventions	262
10.10.2	Local and human stakes in biodiversity: transcending the contradictions?	263
	A conclusion of sorts	267
