Introduction	1
1 Concepts and problems	3
Concepts of equilibrium (balance of nature) and nonequilibrium	3
History of equilibrium and nonequilibrium ecology: some milestones in the evolution of ideas	6
Regulation and equilibrium in ecological systems: some experiments and a critical discussion of arguments given in favour of equilibrium	13
Nonequilibrium in populations and metapopulations: some empirical studies	17
Defining the problem	24
2 Nonequilibrium in communities	27
Definition and evolution of communities	27
Equilibrium, and disturbance leading to nonequilibrium	32
Species nonsaturation and nonequilibria	39
3 Interspecific competition: definition and effects on species	49
Definition and types of competition, resource limitation as its main cause	49
Effects of competition on species	52
4 Interspecific competition: effects in communities and conclusion	70
General aspects and conclusion	78

5 Noncompetitive mechanisms responsible for niche restriction and segregation	81
Evidence for niche restriction even in the absence of potentially interacting species, and mechanisms responsible	81
Niche segregation to ensure reinforcement of reproductive barriers	85
6 Patterns over evolutionary time, present mass extinctions	90
The fossil record and interpretations	90
Recent and present extinctions	95
7 Some detailed examples at the population/metapopulation level	99
Reef fishes: density dependence and equilibrium in populations?	99
Kangaroos: fluctuations in rainfall are the primary determinant of population size, but there is some "regulation" by negative feedback	104
8 Some detailed examples at the community level	109
Tropical rainforests: how is diversity maintained?	109
Ectoparasites of marine fish: non-interactive unsaturated communities	121
Insects on bracken, and wasps: type I communities with little evidence for interspecific competition	127
Larval trematodes in snails: evidence for interspecific competition (and predation) in infracommunities, and for nonequilibrium conditions	131
9 Some detailed biogeographical/macroecological patterns	135
Island biogeography: evidence for equilibrium conditions?	136
Inter- and intraoceanic patterns: historical events and centers of diversity are important	138
Freshwater fishes: diversity is determined by the effects of latitude, area, and history, but the effect of productivity is ambiguous	150
Latitudinal diversity gradients: equilibrium and nonequilibrium explanations	152
General global patterns in diversity	165

10 An autecological comparison: the ecology of some Aspidogastrea	168
11 What explains the differences found? A summary, and prospects for an ecology of the future	178
What explains the differences between communities?	178
A summary, and prospects for an ecology of the future	182
