

Contents

1 Introduction: The Scientific Study of Life 1

The Scope of Biology

- 1.1 Life's levels of organization define the scope of biology 2

The Process of Science

- 1.2 Scientists pose and test hypotheses to answer questions about nature 2
- 1.3 The process of science: A case study in a tropical rain forest 4

Evolution, Unity, and Diversity

- 1.4 The diversity of life can be arranged into three domains 6

- 1.5 Unity in diversity: All forms of life have common features 8

- 1.6 Evolution explains the unity and diversity of life 8

- 1.7 Living organisms and their environments form interconnecting webs 10

Connections to Everyday Life

- 1.8 Biology is connected to our lives in many ways 12

Chapter Review 13

UNIT I The Life of the Cell

2 The Chemical Basis of Life 16

Atoms and Molecules

- 2.1 Biological function starts at the chemical level 18
- 2.2 Life requires about 25 chemical elements 19
- 2.3 Elements can combine to form compounds 19
- 2.4 Atoms consist of protons, neutrons, and electrons 20
- 2.5 Radioactive isotopes can help or harm us 21
- 2.6 Electron arrangement determines the chemical properties of an atom 22
- 2.7 Ionic bonds are attractions between ions of opposite charge 22
- 2.8 Covalent bonds, the sharing of electrons, join atoms into molecules 23

The Properties of Water

- 2.9 Water is a polar molecule 24

- 2.10 Overview: Water's polarity leads to hydrogen bonding and other unusual properties 24

- 2.11 Hydrogen bonds make liquid water cohesive 25

- 2.12 Water's hydrogen bonds moderate temperature 25

- 2.13 Ice is less dense than liquid water 26

- 2.14 Water is a versatile solvent 26

- 2.15 The chemistry of life is sensitive to acidic and basic conditions 27

- 2.16 Acid precipitation threatens the environment 28

Rearrangements of Atoms

- 2.17 Chemical reactions rearrange matter 29

Chapter Review 30

3 The Molecules of Cells 32

Introduction to Organic Compounds and Their Polymers

- 3.1 Life's molecular diversity is based on the properties of carbon 34
- 3.2 Functional groups help determine the properties of organic compounds 35
- 3.3 Cells make a huge number of large molecules from a small set of small molecules 36

Carbohydrates

- 3.4 Monosaccharides are the simplest carbohydrates 37

- 3.5 Cells link single sugars to form disaccharides 38

- 3.6 "How sweet it is ..." 38

- 3.7 Polysaccharides are long chains of sugar units 39

Lipids

- 3.8 Lipids include fats, which are mostly energy-storage molecules 40

- 3.9 Phospholipids, waxes, and steroids are lipids with a variety of functions 41

- 3.10 Anabolic steroids make big bodies and big problems 41

Proteins

- 3.11 Proteins are essential to the structures and activities of life 42
- 3.12 Proteins are made from just 20 kinds of amino acids 42
- 3.13 Amino acids can be linked by peptide bonds 43
- 3.14 Overview: A protein's specific shape determines its function 43
- 3.15 A protein's primary structure is its amino acid sequence 44
- 3.16 Secondary structure is polypeptide coiling or folding produced by hydrogen bonding 44
- 3.17 Tertiary structure is the overall shape of a polypeptide 44

4 A Tour of the Cell 50

Introduction to the World of the Cell

- 4.1 Microscopes provide windows to the world of the cell 52
- 4.2 Cell sizes vary with their function 54
- 4.3 Natural laws limit cell size 54
- 4.4 Prokaryotic cells are small and structurally simple 55
- 4.5 Eukaryotic cells are partitioned into functional compartments 56

Organelles of the Endomembrane System

- 4.6 The nucleus is the cell's genetic control center 58
- 4.7 Overview: Many cell organelles are related through the endomembrane system 58
- 4.8 Rough endoplasmic reticulum makes membrane and proteins 58
- 4.9 Smooth endoplasmic reticulum has a variety of functions 59
- 4.10 The Golgi apparatus finishes, sorts, and ships cell products 60
- 4.11 Lysosomes digest the cell's food and wastes 60

5 The Working Cell 70

Energy and the Cell

- 5.1 Energy is the capacity to perform work 72
- 5.2 Two laws govern energy conversion 72
- 5.3 Chemical reactions either store or release energy 74
- 5.4 ATP shuttles chemical energy within the cell 75

How Enzymes Work

- 5.5 Enzymes speed up the cell's chemical reactions by lowering energy barriers 76
- 5.6 A specific enzyme catalyzes each cellular reaction 77
- 5.7 The cellular environment affects enzyme activity 77
- 5.8 Enzyme inhibitors block enzyme action 78
- 5.9 Some pesticides and antibiotics inhibit enzymes 78

Membrane Structure and Function

- 5.10 Membranes organize the chemical activities of cells 78
- 5.11 Membrane phospholipids form a bilayer 79

6 How Cells Harvest Chemical Energy 88

Introduction to Cellular Respiration

- 6.1 Breathing supplies oxygen to our cells and removes carbon dioxide 90
- 6.2 Cellular respiration banks energy in ATP molecules 90
- 6.3 The human body uses energy from ATP for all its activities 91

- 3.18 Quaternary structure is the relationship among multiple polypeptides of a protein 44
- 3.19 Talking About Science: Linus Pauling contributed to our understanding of the chemistry of life 46

Nucleic Acids

- 3.20 Nucleic acids are information-rich polymers of nucleotides 47
- Chapter Review 48

- 4.12 Abnormal lysosomes can cause fatal diseases 61
- 4.13 Vacuoles function in the general maintenance of the cell 62
- 4.14 A review of the endomembrane system 62

Energy-Converting Organelles

- 4.15 Chloroplasts convert solar energy to chemical energy 63
- 4.16 Mitochondria harvest chemical energy from food 63

The Cytoskeleton and Related Structures

- 4.17 The cell's internal skeleton helps organize its structure and activities 64
- 4.18 Cilia and flagella move when microtubules bend 65

Eukaryotic Cell Surfaces and Junctions

- 4.19 Cell surfaces protect, support, and join cells 66

Functional Categories of Organelles

- 4.20 Eukaryotic organelles comprise four functional categories 67
- 4.21 All life forms share fundamental features 68
- Chapter Review 68

- 5.12 The membrane is a fluid mosaic of phospholipids and proteins 80
- 5.13 Proteins make the membrane a mosaic of function 80
- 5.14 Passive transport is diffusion across a membrane 81
- 5.15 Osmosis is the passive transport of water 82
- 5.16 Water balance between cells and their surroundings is crucial to organisms 82
- 5.17 Specific proteins facilitate diffusion across membranes 83
- 5.18 Cells expend energy for active transport 84
- 5.19 Exocytosis and endocytosis transport large molecules 84
- 5.20 Faulty membranes can overload the blood with cholesterol 85
- 5.21 Chloroplasts and mitochondria make energy available for cellular work 86

Chapter Review 86

Basic Mechanisms of Energy Release and Storage

- 6.4 Cells tap energy from electrons transferred from organic fuels to oxygen 92
- 6.5 Hydrogen carriers such as NAD^+ shuttle electrons in redox reactions 92

- 6.6 Redox reactions release energy when electrons “fall” from a hydrogen carrier to oxygen 93
- 6.7 Two mechanisms generate ATP 94
- Stages of Cellular Respiration and Fermentation**
- 6.8 Overview: Respiration occurs in three main stages 95
- 6.9 Glycolysis harvests chemical energy by oxidizing glucose to pyruvic acid 96
- 6.10 Pyruvic acid is chemically groomed for the Krebs cycle 98
- 6.11 The Krebs cycle completes the oxidation of organic fuel, generating many NADH and FADH₂ molecules 98
- 6.12 Chemiosmosis powers most ATP production 100
- 6.13 Certain poisons interrupt critical events in cellular respiration 101

7 Photosynthesis: Using Light to Make Food 108

An Overview of Photosynthesis

- 7.1 Autotrophs are the producers of the biosphere 110
- 7.2 Photosynthesis occurs in chloroplasts 111
- 7.3 Plants produce O₂ gas by splitting water 112
- 7.4 Photosynthesis is a redox process, as is cellular respiration 112
- 7.5 Overview: Photosynthesis occurs in two stages linked by ATP and NADPH 113

The Light Reactions: Converting Solar Energy to Chemical Energy

- 7.6 Visible radiation drives the light reactions 114
- 7.7 Photosystems capture solar power 114
- 7.8 In the light reactions, electron transport chains generate ATP, NADPH, and O₂ 116
- 7.9 Chemiosmosis powers ATP synthesis in the light reactions 117

- 6.14 Review: Each molecule of glucose yields many molecules of ATP 102
- 6.15 Fermentation is an anaerobic alternative to aerobic respiration 103
- Interconnections Between Molecular Breakdown and Synthesis**
- 6.16 Cells use many kinds of organic molecules as fuel for cellular respiration 104
- 6.17 Food molecules provide raw materials for biosynthesis 105
- 6.18 The fuel for respiration ultimately comes from photosynthesis 106
- Chapter Review 106**

The Calvin Cycle: Converting CO₂ to Sugars

- 7.10 ATP and NADPH power sugar synthesis in the Calvin cycle 118
- Photosynthesis Reviewed and Extended**
- 7.11 Review: Photosynthesis uses light energy to make food molecules 119
- 7.12 C₄ and CAM plants have special adaptations that save water 120
- Photosynthesis, Solar Radiation, and Earth's Atmosphere**
- 7.13 Photosynthesis moderates the greenhouse effect; deforestation can intensify it 121
- 7.14 Talking About Science: Mario Molina talks about Earth's protective ozone layer 122
- Chapter Review 123**

UNIT II Cellular Reproduction and Genetics

8 The Cellular Basis of Reproduction and Inheritance 126

Connections Between Cell Division and Reproduction

- 8.1 Like begets like, more or less 128
- 8.2 Cells arise only from preexisting cells 129
- 8.3 Prokaryotes reproduce by binary fission 129

The Eukaryotic Cell Cycle and Mitosis

- 8.4 The large, complex chromosomes of eukaryotes duplicate with each cell division 130
- 8.5 The cell cycle multiplies cells 130

- 8.6 Cell division is a continuum of dynamic changes 131
- 8.7 Cytokinesis differs for plant and animal cells 132
- 8.8 Anchorage, cell density, and chemical growth factors affect cell division 135
- 8.9 Growth factors signal the cell-cycle control system 136
- 8.10 Growing out of control, cancer cells produce malignant tumors 137
- 8.11 Review of the functions of mitosis: Growth, cell replacement, and asexual reproduction 138
- Meiosis and Crossing Over**
- 8.12 Chromosomes are matched in homologous pairs 138
- 8.13 Gametes have a single set of chromosomes 139
- 8.14 Meiosis reduces the chromosome number from diploid to haploid 140
- 8.15 Review: A comparison of mitosis and meiosis 142
- 8.16 Independent orientation of chromosomes in meiosis and random fertilization lead to varied offspring 143

9 Patterns of Inheritance 155

Mendel's Principles

- 9.1 The science of genetics has ancient roots 156
- 9.2 Experimental genetics began in an abbey garden 156
- 9.3 Mendel's principle of segregation describes inheritance of a single characteristic 158
- 9.4 Homologous chromosomes bear the two alleles for each characteristic 159
- 9.5 The principle of independent assortment is revealed by tracking two characteristics at once 160
- 9.6 Geneticists use the testcross to determine unknown genotypes 161
- 9.7 Mendel's principles reflect the rules of probability 162
- 9.8 Genetic traits in humans can be tracked through family pedigrees 163
- 9.9 Many inherited disorders in humans are controlled by a single gene 164
- 9.10 Fetal testing can spot many inherited disorders early in pregnancy 166

Variations on Mendel's Principles

- 9.11 The relationship of genotype to phenotype is rarely simple 168

- 8.17 Homologous chromosomes carry different versions of genes 144
- 8.18 Crossing over further increases genetic variability 144
- Alterations of Chromosome Number and Structure**
- 8.19 A karyotype is a photographic inventory of an individual's chromosomes 146
- 8.20 An extra copy of chromosome 21 causes Down syndrome 147
- 8.21 Accidents during meiosis can alter chromosome number 148
- 8.22 Abnormal numbers of sex chromosomes do not usually affect survival 149
- 8.23 Alterations of chromosome structure can cause birth defects and cancer 150
- Chapter Review** 151

- 9.12 Incomplete dominance results in intermediate phenotypes 168
- 9.13 Many genes have more than two alleles in the population 169
- 9.14 A single gene may affect many phenotypic characteristics 170
- 9.15 Talking About Science: Dr. David Satcher discusses sickle-cell disease and genetic screening 171
- 9.16 A single characteristic may be influenced by many genes 172
- The Chromosomal Basis of Inheritance**
- 9.17 Chromosome behavior accounts for Mendel's principles 173
- 9.18 Genes on the same chromosome tend to be inherited together 174
- 9.19 Crossing over produces new combinations of alleles 174
- 9.20 Geneticists use crossover data to map genes 176
- Sex Chromosomes and Sex-Linked Genes**
- 9.21 Chromosomes determine sex in many species 177
- 9.22 Sex-linked genes exhibit a unique pattern of inheritance 178
- 9.23 Sex-linked disorders affect mostly males 179
- Chapter Review** 180

10 Molecular Biology of the Gene 182

The Structure of the Genetic Material

- 10.1 Experiments showed that DNA is the genetic material 184
- 10.2 DNA and RNA are polymers of nucleotides 186
- 10.3 DNA is a double-stranded helix 188

DNA Replication

- 10.4 DNA replication depends on specific base pairing 190
- 10.5 DNA replication: A closer look 191

The Flow of Genetic Information from DNA to RNA to Protein

- 10.6 The DNA genotype is expressed as proteins, which provide the molecular basis for phenotypic traits 192
- 10.7 Genetic information is written as codons and translated into amino acid sequences 193

- 10.8 The genetic code is the Rosetta stone of life 194
- 10.9 Transcription produces genetic messages in the form of RNA 195
- 10.10 Genetic messages are translated in the cytoplasm 196
- 10.11 Transfer RNA molecules serve as interpreters during translation 196
- 10.12 Ribosomes build polypeptides 198
- 10.13 An initiation codon marks the start of an mRNA message 198
- 10.14 Elongation adds amino acids to the polypeptide chain until a stop codon terminates translation 199
- 10.15 Review: The flow of genetic information in the cell is DNA→RNA→protein 200
- 10.16 Mutations can change the meaning of genes 201

Viruses: Genes in Packages

- 10.17 Viral DNA may become part of the host chromosome 202
- 10.18 Many viruses cause disease in animals 203
- 10.19 Plant viruses are serious agricultural pests 204
- 10.20 Emerging viruses threaten human health 204

- 10.21 The AIDS virus makes DNA on an RNA template 205
- 10.22 Virus research and molecular genetics are intertwined 206
- Chapter Review 206

11 The Control of Gene Expression 208

Gene Regulation in Prokaryotes

- 11.1 Proteins interacting with DNA turn prokaryotic genes on or off in response to environmental changes 210

Cellular Differentiation and Gene Regulation in Eukaryotes

- 11.2 Differentiation produces a variety of specialized cells in eukaryotes 212
- 11.3 Specialized cells may retain all of their genetic potential 212
- 11.4 Each type of differentiated cell has a particular pattern of expressed genes 214
- 11.5 DNA packing in eukaryotic chromosomes helps regulate gene expression 214
- 11.6 Complex assemblies of proteins control eukaryotic transcription 216
- 11.7 Eukaryotic RNA is processed: Cap and tail are added and noncoding segments removed 217
- 11.8 Translation and later stages of gene expression are also subject to regulation 218
- 11.9 Review: Multiple mechanisms regulate gene expression in eukaryotes 219

The Genetic Control of Embryonic Development

- 11.10 Cascades of gene expression and cell-to-cell signaling direct the development of an animal 220
- 11.11 Signal-transduction pathways convert messages received at the cell surface into responses within the cell 221
- 11.12 Key developmental genes are very ancient 222

The Genetic Basis of Cancer

- 11.13 Cancer results from mutations in genes that control cell division 222
- 11.14 Oncogene proteins and faulty tumor-suppressor proteins can interfere with normal signal-transduction pathways 224
- 11.15 Multiple genetic changes underlie the development of cancer 225
- 11.16 Talking About Science: Mary-Claire King discusses mutations that cause breast cancer 226
- 11.17 Changes in lifestyle can reduce the risk of cancer 227
- Chapter Review 228

12 DNA Technology and the Human Genome 230

Bacteria as Tools for Manipulating DNA

- 12.1 In nature, bacteria can transfer DNA in three ways 232
- 12.2 Bacterial plasmids can serve as carriers for gene transfer 233
- 12.3 Plasmids are used to customize bacteria: An overview 234
- 12.4 Enzymes are used to "cut and paste" DNA 235
- 12.5 Genes can be cloned in recombinant plasmids: A closer look 236
- 12.6 Cloned genes can be stored in genomic libraries 237

Other Tools of DNA Technology

- 12.7 Reverse transcriptase helps make genes for cloning 237
- 12.8 Nucleic acid probes identify clones carrying specific genes 238
- 12.9 Automation makes rapid DNA synthesis and DNA sequencing possible 239
- 12.10 Gel electrophoresis sorts DNA molecules by size 239
- 12.11 Restriction fragment analysis is a powerful method that detects differences in DNA sequences 240
- 12.12 The PCR method is used to amplify DNA sequences 242

The Challenge of the Human Genome

- 12.13 The human genome is enormous, and most of the DNA does not consist of genes 242

- 12.14 Talking About Science: Barbara McClintock discovered "jumping genes" 243
- 12.15 The Human Genome Project is a scientific adventure 244

Other Applications of DNA Technology

- 12.16 DNA technology is used in courts of law 245
- 12.17 Bacteria, yeasts, and mammalian cells are used to mass-produce gene products 246
- 12.18 DNA technology is revolutionizing the pharmaceutical industry and human medicine 247
- 12.19 For agriculture, DNA technology helps make growth-enhancing products and plants and animals with desired traits 248
- 12.20 Gene therapy may someday help treat genetic disorders and other kinds of disease 249

Risks and Ethical Questions

- 12.21 Genetic engineering involves some risks 250
- 12.22 DNA technology raises important ethical questions 250
- Chapter Review 252

UNIT III Concepts of Evolution

13 How Populations Evolve 256

Evidence of Evolution

- 13.1 A sea voyage helped Darwin frame his theory of evolution 258
- 13.2 The study of fossils provides strong evidence for evolution 260
- 13.3 A mass of evidence validates the evolutionary view of life 262

Darwin's Theory and the Modern Synthesis

- 13.4 Darwin proposed natural selection as the mechanism for evolution 264
- 13.5 Natural selection is a prominent force in nature 266
- 13.6 Populations are the units of evolution 267
- 13.7 Microevolution is change in a population's gene pool over time 268
- 13.8 The gene pool of an idealized nonevolving population remains constant over the generations 268
- 13.9 The Hardy-Weinberg equation is useful in public health science 269
- 13.10 Five conditions are required for Hardy-Weinberg equilibrium 270

- 13.11 There are five potential causes for microevolution 270
- 13.12 Adaptive change results when natural selection upsets genetic equilibrium 272

Variation and Natural Selection

- 13.13 Variation is extensive in most populations 272
- 13.14 Two random processes generate variation 273
- 13.15 Overview: How natural selection affects variation 274
- 13.16 Endangered species often have reduced variation 274
- 13.17 Not all genetic variation may be subject to natural selection 275
- 13.18 The perpetuation of genes defines evolutionary fitness 276
- 13.19 Natural selection acts on whole organisms and affects genotypes as a result 276
- 13.20 There are three main modes of natural selection 277
- 13.21 Directional selection has produced resistant populations of pests and parasites 278

Chapter Review 278

14 The Origin of Species 280

Concepts of Species

- 14.1 What is a species? 282
- 14.2 The biological species concept does not work in all situations 283
- 14.3 Reproductive barriers keep species separate 284

Mechanisms of Speciation

- 14.4 Geographical isolation can lead to speciation 286
- 14.5 Islands are living laboratories of speciation 287

- 14.6 New species can also arise within the same geographic area as the parent species 288
- 14.7 Polyploid plants clothe and feed us 289
- 14.8 The tempo of speciation can appear steady or jumpy 290
- 14.9 Talking About Science: Evolutionary biologist Richard Dawkins expounds on the power of natural selection 292

Chapter Review 292

15 Tracing Evolutionary History 294

Earth History and Macroevolution

- 15.1 The fossil record chronicles macroevolution 296
- 15.2 The actual ages of rocks and fossils mark geological time 297
- 15.3 Continental drift has played a major role in macroevolution 298
- 15.4 Tectonic trauma imperils local life 300
- 15.5 Mass extinctions were followed by diversification of life forms 300
- 15.6 Key adaptations may enable species to survive and proliferate after mass extinctions 302
- 15.7 Delayed maturity was a key novelty in human evolution 303

- 15.8 What accounts for evolutionary trends? 304
- 15.9 Phylogenetic trees symbolize evolutionary history 305

Systematics and Phylogenetic Biology

- 15.10 Systematists classify organisms by phylogeny 306
- 15.11 Homology indicates common ancestry, but analogy does not 307
- 15.12 Molecular biology is a powerful tool in systematics 308
- 15.13 Systematists attempt to make classification consistent with phylogeny 310

The Domains of Life

- 15.14 Arranging life into kingdoms is a work in progress 312

Chapter Review 313

UNIT III Concepts of Evolution

13 How Populations Evolve 256

Evidence of Evolution

- 13.1 A sea voyage helped Darwin frame his theory of evolution 258
- 13.2 The study of fossils provides strong evidence for evolution 260
- 13.3 A mass of evidence validates the evolutionary view of life 262

Darwin's Theory and the Modern Synthesis

- 13.4 Darwin proposed natural selection as the mechanism for evolution 264
- 13.5 Natural selection is a prominent force in nature 266
- 13.6 Populations are the units of evolution 267
- 13.7 Microevolution is change in a population's gene pool over time 268
- 13.8 The gene pool of an idealized nonevolving population remains constant over the generations 268
- 13.9 The Hardy-Weinberg equation is useful in public health science 269
- 13.10 Five conditions are required for Hardy-Weinberg equilibrium 270

- 13.11 There are five potential causes for microevolution 270
- 13.12 Adaptive change results when natural selection upsets genetic equilibrium 272

Variation and Natural Selection

- 13.13 Variation is extensive in most populations 272
- 13.14 Two random processes generate variation 273
- 13.15 Overview: How natural selection affects variation 274
- 13.16 Endangered species often have reduced variation 274
- 13.17 Not all genetic variation may be subject to natural selection 275
- 13.18 The perpetuation of genes defines evolutionary fitness 276
- 13.19 Natural selection acts on whole organisms and affects genotypes as a result 276
- 13.20 There are three main modes of natural selection 277
- 13.21 Directional selection has produced resistant populations of pests and parasites 278

Chapter Review 278

14 The Origin of Species 280

Concepts of Species

- 14.1 What is a species? 282
- 14.2 The biological species concept does not work in all situations 283
- 14.3 Reproductive barriers keep species separate 284

Mechanisms of Speciation

- 14.4 Geographical isolation can lead to speciation 286
- 14.5 Islands are living laboratories of speciation 287

- 14.6 New species can also arise within the same geographic area as the parent species 288
- 14.7 Polyploid plants clothe and feed us 289
- 14.8 The tempo of speciation can appear steady or jumpy 290
- 14.9 Talking About Science: Evolutionary biologist Richard Dawkins expounds on the power of natural selection 292

Chapter Review 292

15 Tracing Evolutionary History 294

Earth History and Macroevolution

- 15.1 The fossil record chronicles macroevolution 296
- 15.2 The actual ages of rocks and fossils mark geological time 297
- 15.3 Continental drift has played a major role in macroevolution 298
- 15.4 Tectonic trauma imperils local life 300
- 15.5 Mass extinctions were followed by diversification of life forms 300
- 15.6 Key adaptations may enable species to survive and proliferate after mass extinctions 302
- 15.7 Delayed maturity was a key novelty in human evolution 303

- 15.8 What accounts for evolutionary trends? 304
- 15.9 Phylogenetic trees symbolize evolutionary history 305

Systematics and Phylogenetic Biology

- 15.10 Systematists classify organisms by phylogeny 306
- 15.11 Homology indicates common ancestry, but analogy does not 307
- 15.12 Molecular biology is a powerful tool in systematics 308
- 15.13 Systematists attempt to make classification consistent with phylogeny 310

The Domains of Life

- 15.14 Arranging life into kingdoms is a work in progress 312

Chapter Review 313

UNIT IV The Evolution of Biological Diversity

16 The Origin and Evolution of Microbial Life: Prokaryotes and Protists 316

Early Earth and the Origin of Life

- 16.1 Life began on a young Earth 318
- 16.2 How did life originate? 320
- 16.3 Talking About Science: Stanley Miller's experiments showed that organic molecules could have arisen on a lifeless Earth 320
- 16.4 The first polymers may have formed on hot rocks or clay 322
- 16.5 The first genetic material and enzymes may both have been RNA 322
- 16.6 Molecular cooperatives enclosed by membranes probably preceded the first real cells 323

Prokaryotes

- 16.7 Prokaryotes have inhabited Earth for billions of years 324
- 16.8 Archaea and bacteria are the two main branches of prokaryotic evolution 324
- 16.9 Prokaryotes come in a variety of shapes 325
- 16.10 Prokaryotes obtain nourishment in a variety of ways 326
- 16.11 The first cells probably used chemicals for both carbon and energy 326
- 16.12 Archaea thrive in extreme environments 327
- 16.13 Diverse structural features help prokaryotes thrive almost everywhere 328
- 16.14 Cyanobacteria sometimes "bloom" in aquatic environments 329
- 16.15 Some bacteria cause disease 330

- 16.16 Koch's postulates are used to identify disease-causing bacteria 331
- 16.17 Chemical cycles in our environment depend on prokaryotes 332
- 16.18 Prokaryotes may help us solve some environmental problems 332
- 16.19 Summary: Prokaryotes are at the foundation of life on Earth 333

Protists

- 16.20 The eukaryotic cell probably originated as a community of prokaryotes 334
- 16.21 Protists, unicellular eukaryotes and their close multicellular relatives, probably represent multiple kingdoms 335
- 16.22 Protozoans are protists that ingest their food 336
- 16.23 Cellular slime molds have both unicellular and multicellular stages 337
- 16.24 Plasmodial slime molds have brightly colored stages with many nuclei 338
- 16.25 Photosynthetic protists are called algae 338
- 16.26 Seaweeds are multicellular marine algae 340
- 16.27 Multicellular life may have evolved from colonial protists 341
- 16.28 Multicellular life has diversified over hundreds of millions of years 342

Chapter Review 342

17 Plants, Fungi, and the Colonization of Land 344

- 17.1 What is a plant? 346

Plant Evolution and Diversity

- 17.2 Plants probably evolved from green algae called charophytes 347
- 17.3 Plant diversity provides clues to the evolutionary history of the plant kingdom 348

Alternation of Generations and Plant Life Cycles

- 17.4 Haploid and diploid generations alternate in plant life cycles 350
- 17.5 Mosses have a dominant gametophyte 350
- 17.6 Ferns, like most plants, have a dominant sporophyte 351
- 17.7 Seedless plants formed vast "coral forests" 352
- 17.8 A pine tree is a sporophyte with tiny gametophytes in its cones 352
- 17.9 Sustaining coniferous forests poses many challenges 354
- 17.10 Angiosperms dominate most landscapes today 354

- 17.11 The flower is the centerpiece of angiosperm reproduction 355
- 17.12 The angiosperm plant is a sporophyte with gametophytes in its flowers 356
- 17.13 The structure of a fruit reflects its function in seed dispersal 357
- 17.14 Interactions with animals have profoundly influenced angiosperm evolution 358

Fungi

- 17.15 Fungi and plants moved onto land together 359
 - 17.16 Fungi absorb food after digesting it outside their bodies 360
 - 17.17 Many fungi have three distinct phases in their life cycle 361
 - 17.18 Lichens consist of fungi living mutualistically with photosynthetic organisms 362
 - 17.19 Parasitic fungi harm plants and animals 363
 - 17.20 Fungi have enormous ecological and practical impacts 364
- #### Chapter Review 364

18 The Evolution of Animal Diversity 366

Animal Evolution and Diversity

- 18.1 What is an animal? 368
- 18.2 The animal kingdom probably originated from colonial protists 369
- Invertebrates**
- 18.3 Sponges have relatively simple, porous bodies 370
- 18.4 Cnidarians are radial animals with stinging threads 371
- 18.5 Most animals are bilaterally symmetrical 372
- 18.6 Flatworms are the simplest bilateral animals 372
- 18.7 Most animals have a body cavity 374
- 18.8 Roundworms have a pseudocoelom and a complete digestive tract 375
- 18.9 Diverse mollusks are variations on a common body plan 376
- 18.10 Most animals have segmented bodies 378
- 18.11 Earthworms and other annelids are segmented worms 379
- 18.12 Arthropods are the most numerous and widespread of all animals 380
- 18.13 Insects are the most diverse group of organisms 382

- 18.14 Echinoderms have spiny skin, an endoskeleton, and a water vascular system for movement 384
- 18.15 Our own phylum, Chordata, is distinguished by four features 385

Vertebrates

- 18.16 A skull and a backbone are hallmarks of vertebrates 386
- 18.17 Most vertebrates have hinged jaws 386
- 18.18 Fishes are jawed vertebrates with gills and paired fins 387
- 18.19 Amphibians were the first land vertebrates 388
- 18.20 Reptiles have more terrestrial adaptations than amphibians 389
- 18.21 Birds share many features with their reptilian ancestors 390
- 18.22 Mammals also evolved from reptiles 391

The Phylogeny of the Animal Kingdom

- 18.23 A phylogenetic tree gives animal diversity an evolutionary perspective 392
- 18.24 Change is a fundamental feature of the environment and of life 394

Chapter Review 395

19 Human Evolution 398

Primate Diversity

- 19.1 The human story begins with our primate heritage 400
- 19.2 Apes are our closest relatives 402

Hominid Evolution

- 19.3 The human branch of the primate tree is only a few million years old 403
- 19.4 Upright posture evolved well before our enlarged brain 404
- 19.5 *Homo erectus* gave rise to *Homo sapiens* 404
- 19.6 When and where did modern humans arise? 405

Our Cultural History and Its Consequences

- 19.7 Culture gives us enormous power to change our environment 406
- 19.8 Scavenging-gathering-hunting was the first major stage of culture 406
- 19.9 Agriculture was a second major stage of culture 407
- 19.10 The machine age is the third major stage of culture 407

Chapter Review 408

UNIT V Animals: Form and Function

20 Unifying Concepts of Animal Structure and Function 412

The Hierarchy of Structural Organization in an Animal

- 20.1 Structure fits function in the animal body 414
- 20.2 Animal structure has a hierarchy 415
- 20.3 Tissues are groups of cells with a common structure and function 415
- 20.4 Epithelial tissue covers and lines the body and its parts 416
- 20.5 Connective tissue binds other tissues and provides support matrices 417
- 20.6 Muscle tissue functions in movement 418
- 20.7 Nervous tissue forms a communication network 418

- 20.8 Several tissues arranged in a particular way form an organ 419
- 20.9 The body is a cooperative of organ systems 420
- 20.10 New imaging technology reveals the inner body 422

Exchanges with the External Environment

- 20.11 Structural adaptations enhance chemical exchange between animals and their environment 424
- 20.12 Animals regulate their internal environment 425
- 20.13 Homeostasis depends on negative feedback 426

Chapter Review 427

21 Nutrition and Digestion 428

Obtaining and Processing Food

- 21.1 Animals ingest their food in a variety of ways 430
- 21.2 Overview: Food processing occurs in four stages 431
- 21.3 Digestion occurs in specialized compartments 432
- Human Digestive System**
- 21.4 The human digestive system consists of an alimentary canal and accessory glands 434
- 21.5 Digestion begins in the oral cavity 435
- 21.6 The food and breathing passages both open into the pharynx 435
- 21.7 The esophagus squeezes food along to the stomach 436
- 21.8 The stomach stores food and breaks it down with acid and enzymes 436
- 21.9 Bacterial infections can cause ulcers 437
- 21.10 The small intestine is the major organ of chemical digestion and nutrient absorption 438

- 21.11 The large intestine reclaims water 440

Diets and Digestive Adaptations

- 21.12 Adaptations of vertebrate digestive systems reflect diet 440
- Nutrition**
- 21.13 Overview: A healthful diet satisfies three needs 442
- 21.14 Chemical energy powers the body 442
- 21.15 Body fat and fat diets 443
- 21.16 Nine amino acids are essential nutrients 444
- 21.17 A healthful diet includes 13 vitamins 444
- 21.18 Essential minerals are required for many body functions 446
- 21.19 What do food labels tell us? 447
- 21.20 Diet can influence cardiovascular disease and cancer 448
- Chapter Review** 448

22 Respiration: The Exchange of Gases 450

Mechanisms of Gas Exchange

- 22.1 Overview: Gas exchange involves breathing, the transport of gases, and the servicing of tissue cells 452
- 22.2 Animals exchange O_2 and CO_2 through moist body surfaces 452
- 22.3 Gills are adapted for gas exchange in aquatic environments 454
- 22.4 Countercurrent flow in the gills enhances O_2 transfer 455
- 22.5 The tracheal system of insects provides direct exchange between the air and body cells 455
- 22.6 Terrestrial vertebrates have lungs 456

- 22.7 Smoking is one of the deadliest assaults on our respiratory system 457
- 22.8 Breathing ventilates the lungs 458
- 22.9 Breathing is automatically controlled 459

Transport of Gases in the Body

- 22.10 Blood transports the respiratory gases, with hemoglobin carrying the oxygen 460
- 22.11 Hemoglobin helps transport CO_2 and buffer the blood 461
- 22.12 The human fetus exchanges gases with the mother's bloodstream 462
- Chapter Review** 462

23 Circulation 464

- 23.1 The circulatory system associates intimately with all body tissues 466

Mechanisms of Internal Transport

- 23.2 Several types of internal transport have evolved in animals 466
- 23.3 Vertebrate cardiovascular systems reflect evolution 468

The Mammalian Cardiovascular System

- 23.4 A trip through the mammalian cardiovascular system 469
- 23.5 The structure of blood vessels matches their functions 470
- 23.6 The heart contracts and relaxes rhythmically 470
- 23.7 The pacemaker sets the tempo of the heartbeat 471
- 23.8 What is a heart attack? 472
- 23.9 Blood exerts pressure on vessel walls 473

- 23.10 Measuring blood pressure can reveal cardiovascular problems 474
- 23.11 Smooth muscle controls the distribution of blood 475
- 23.12 Capillaries allow the transfer of substances through their walls 476

Structure and Function of Blood

- 23.13 Blood consists of cells suspended in plasma 477
- 23.14 Red blood cells transport oxygen 478
- 23.15 White blood cells help defend the body 478
- 23.16 Blood clots plug leaks when blood vessels are injured 479
- 23.17 Stem cells offer a potential cure for leukemia and other blood cell diseases 480
- Chapter Review** 480

24 The Immune System 482

Nonspecific Defenses Against Infection

- 24.1 Nonspecific defenses against infection include the skin and mucous membranes, phagocytic cells, and antimicrobial proteins 484

- 24.2 The inflammatory response mobilizes nonspecific defense forces 485
- 24.3 The lymphatic system becomes a crucial battleground during infection 486

Specific Immunity

- 24.4 The immune response counters specific invaders 487
- 24.5 Lymphocytes mount a dual defense 488
- 24.6 Antigens have specific regions where antibodies bind to them 489
- 24.7 Clonal selection musters defensive forces against specific antigens 490
- 24.8 The initial immune response results in a type of “memory” 491
- 24.9 Overview: B cells are the warriors of humoral immunity 492
- 24.10 Antibodies are the weapons of humoral immunity 493
- 24.11 Antibodies mark antigens for elimination 494
- 24.12 Monoclonal antibodies are powerful tools in the lab and clinic 495

- 24.13 T cells mount the cell-mediated defense and aid humoral immunity 496

- 24.14 Cytotoxic T cells may help prevent cancer 497
- 24.15 The immune system depends on our molecular fingerprints 498

Disorders of the Immune System

- 24.16 Malfunction or failure of the immune system causes disease 498
- 24.17 Allergies are overreactions to certain environmental antigens 499
- 24.18 AIDS leaves the body defenseless 500

Chapter Review 500

25 Control of the Internal Environment 502

Thermoregulation

- 25.1 Heat is gained or lost in four ways 504
- 25.2 Thermoregulation depends on both heat production and heat gain or loss 504
- 25.3 Behavior often affects body temperature 505
- 25.4 Reducing the metabolic rate saves energy 506

Osmoregulation and Excretion

- 25.5 Osmoregulation: All animals balance the gain and loss of water and dissolved solutes 506
- 25.6 Sweating can produce serious water loss 508
- 25.7 Many freshwater animals face seasonal dehydration 508

- 25.8 Animals must dispose of nitrogenous wastes 509

- 25.9 The excretory system plays several major roles in homeostasis 510

- 25.10 Overview: The key functions of the excretory system are filtration, reabsorption, secretion, and excretion 511

- 25.11 From blood filtrate to urine: A closer look 512

- 25.12 Kidney dialysis can be a lifesaver 513

Homeostatic Functions of the Liver

- 25.13 The liver is vital in homeostasis 514

Chapter Review 514

26 Chemical Regulation 516

The Nature of Chemical Regulation

- 26.1 Chemical signals coordinate body functions 518
- 26.2 Hormones affect target cells by two main signaling mechanisms 519

The Vertebrate Endocrine System

- 26.3 Overview: The vertebrate endocrine system 520
- 26.4 The hypothalamus, closely tied to the pituitary, connects the nervous and endocrine systems 522
- 26.5 The hypothalamus and pituitary have multiple endocrine functions 522

Hormones and Homeostasis

- 26.6 The thyroid regulates development and metabolism 524

- 26.7 Hormones from the thyroid and the parathyroids maintain calcium homeostasis 524

- 26.8 Pancreatic hormones manage cellular fuel 526

- 26.9 Diabetes is a common endocrine disorder 527

- 26.10 The adrenal glands mobilize responses to stress 528

- 26.11 Glucocorticoids offer relief from pain, but not without serious risks 529

- 26.12 The gonads secrete sex hormones 530

Chapter Review 530

27 Reproduction and Embryonic Development 532

Asexual and Sexual Reproduction

- 27.1 Sexual and asexual reproduction are both common among animals 534

Human Reproduction

- 27.2 Reproductive anatomy of the human female 536
- 27.3 Reproductive anatomy of the human male 538
- 27.4 The formation of sperm and ova requires meiosis 540
- 27.5 Hormones synchronize cyclic changes in the ovary and uterus 542
- 27.6 The human sexual response occurs in four phases 544
- 27.7 Sexual activity can transmit disease 544

- 27.8 Contraception prevents unwanted pregnancy 545

Principles of Embryonic Development

- 27.9 Fertilization results in a zygote and triggers embryonic development 546

- 27.10 Cleavage produces a ball of cells from the zygote 548

- 27.11 Gastrulation produces a three-layered embryo 548

- 27.12 Organs start to form after gastrulation 550

- 27.13 Changes in cell shape, cell migration, and programmed cell death give form to the developing animal 552

- 27.14 Embryonic induction initiates organ formation 552

- 27.15 Pattern formation organizes the animal body 553

Human Development

- 27.16** The embryo and placenta take shape during the first month of pregnancy 554
- 27.17** Human development from conception to birth is divided into three trimesters 556

- 27.18** Childbirth is hormonally induced and occurs in three stages 558
- 27.19** Reproductive technology increases our reproductive options 559
- Chapter Review** 560

28 Nervous Systems 562

Nervous System Structure and Function

- 28.1** Nervous systems receive sensory input, interpret it, and send out appropriate commands 564
- 28.2** Neurons are the functional units of nervous systems 565

Nerve Signals and Their Transmission

- 28.3** A neuron maintains a resting potential across its membrane 566
- 28.4** A nerve signal begins as a change in the membrane potential 566
- 28.5** The action potential regenerates itself along the neuron 568
- 28.6** Neurons communicate at synapses 569
- 28.7** Chemical synapses make complex information processing possible 570
- 28.8** A variety of small molecules function as neurotransmitters 570
- 28.9** Many stimulants and depressants act on chemical synapses 571

Nervous Systems

- 28.10** Nervous system organization usually correlates with body symmetry 572
- 28.11** Vertebrate nervous systems are highly centralized and cephalized 573

- 28.12** The peripheral nervous system of vertebrates is a functional hierarchy 574
- 28.13** Opposing actions of sympathetic and parasympathetic neurons regulate the internal environment 574
- 28.14** The vertebrate brain develops from three anterior bulges of the spinal cord 576

The Human Brain

- 28.15** The structure of a living supercomputer: The human brain 576
- 28.16** The cerebral cortex is a mosaic of specialized, interactive regions 578
- 28.17** Talking About Science: Roger Sperry discovered that the right and left cerebral hemispheres function differently 579
- 28.18** Several parts of the brain regulate sleep and arousal 580
- 28.19** The limbic system is involved in emotions, memory, and learning 581
- 28.20** The cellular changes underlying memory and learning probably occur at synapses 582

Chapter Review 582

29 The Senses 584

- 29.1** Sensory inputs become sensations and perceptions in the brain 586

Sensory Reception

- 29.2** Sensory receptor cells convert stimuli into electrical energy 586
- 29.3** Specialized sensory receptors detect five categories of stimuli 588

Vision

- 29.4** Three different types of eyes have evolved among invertebrates 590
- 29.5** Vertebrates have single-lens eyes 590
- 29.6** To focus, a lens changes position or shape 591

- 29.7** How do corrective lenses work? 592
- 29.8** Our photoreceptor cells are rods and cones 593

Hearing and Balance

- 29.9** The ear converts air pressure waves into action potentials that are perceived as sound 594
- 29.10** The inner ear houses our organ of balance 596
- 29.11** What causes motion sickness? 596

Taste and Smell

- 29.12** Odor and taste receptors detect categories of chemicals 597
- 29.13** Review: The central nervous system couples stimulus with response 598
- Chapter Review** 598

30 How Animals Move 600

Movement and Locomotion

- 30.1** Diverse means of animal locomotion have evolved 602
- ### **Skeletal Support**
- 30.2** Skeletons function in support, movement, and protection 604
 - 30.3** The human skeleton is a unique variation on an ancient theme 606
 - 30.4** Skeletal disorders afflict millions 607
 - 30.5** Bones are complex living organs 608
 - 30.6** Bone growth is a major feature of human development 608

Muscle Contraction and Movement

- 30.7** The skeleton and muscles interact in movement 609
- 30.8** Each muscle cell has its own contractile apparatus 610
- 30.9** A muscle contracts when thin filaments slide across thick filaments 610
- 30.10** Motor neurons stimulate muscle contraction 612
- 30.11** Robots mimic animal movements 613
- 30.12** The structure-function theme underlies all the parts and activities of an animal 614
- Chapter Review** 615

UNIT VI Plants: Form and Function

31 Plant Structure, Reproduction, and Development 618

- 31.1 Talking About Science: Plant scientist Katherine Esau, preeminent student of plant structure and function 620

Plant Structure and Function

- 31.2 There are two major groups of angiosperms: monocots and dicots 621
- 31.3 The plant body consists of roots and shoots 622
- 31.4 Many plants have modified roots and shoots 623
- 31.5 Plant cells and tissues are diverse in structure and function 624
- 31.6 Three tissue systems make up the plant body 626

Plant Growth

- 31.7 Primary growth lengthens roots and shoots 628

- 31.8 Secondary growth increases the girth of woody plants 630

Plant Reproduction

- 31.9 Overview: The sexual life of a flowering plant 632
- 31.10 The development of pollen and ovules culminates in fertilization 632
- 31.11 The ovule develops into a seed 634
- 31.12 The ovary develops into a fruit 635
- 31.13 Seed germination continues the life cycle 636
- 31.14 Asexual reproduction produces plant clones 637
- 31.15 Vegetative reproduction is a mainstay of modern agriculture 638

Chapter Review 638

32 Plant Nutrition and Transport 640

The Uptake and Transport of Plant Nutrients

- 32.1 Plants acquire their nutrients from soil and air 642
- 32.2 The plasma membranes of root cells control solute uptake 643
- 32.3 Transpiration pulls water up xylem vessels 644
- 32.4 Guard cells control transpiration 645
- 32.5 Phloem transports sugars 646

Plant Nutrients and the Soil

- 32.6 Plant health depends on a complete diet of essential inorganic nutrients 648
- 32.7 You can diagnose some nutrient deficiencies in your house and garden plants 649
- 32.8 Soil in the life of plants: A closer look 650

- 32.9 Soil conservation is essential to human life 651

- 32.10 Talking About Science: Organic farmer Stephen Moore uses no commercial chemicals 652

- 32.11 Fungi help most plants absorb nutrients from the soil 652

- 32.12 The plant kingdom includes parasites and carnivores 653

- 32.13 Most plants depend on bacteria to supply nitrogen 654

- 32.14 Legumes and certain other kinds of plants have built-in nitrogen-fixing bacteria 654

Plant Nutrients and Agriculture

- 32.15 A major goal of agricultural research is to improve the protein content of crops 655

- 32.16 Genetic engineering may greatly increase crop yields 656

Chapter Review 656

33 Control Systems in Plants 658

Plant Hormones

- 33.1 Experiments on how plants turn toward light led to the discovery of a plant hormone 660
- 33.2 Five major types of hormones regulate plant growth and development 662
- 33.3 Auxins stimulate the elongation of cells in young shoots 662
- 33.4 Cytokinins stimulate cell division 664
- 33.5 Gibberellins affect stem elongation and have numerous other effects 664
- 33.6 Abscissic acid inhibits many plant processes 665
- 33.7 Ethylene triggers fruit ripening and other aging processes 666
- 33.8 Plant hormones have many agricultural uses 667

Growth Responses and Biological Rhythms in Plants

- 33.9 Tropisms orient plant growth toward or away from environmental stimuli 668

- 33.10 Plants have internal clocks 669

- 33.11 Plants mark the seasons by measuring photoperiod 670

- 33.12 Phytochrome is a light detector that may help set the biological clock 671

- 33.13 Talking About Science: Gloria Coruzzi studies the genetic basis of control systems in the model plant *Arabidopsis* 672

Plant Defenses

- 33.14 Defenses against herbivores and infectious microbes have evolved in plants 672

- 33.15 Talking About Science: Plant biochemist Eloy Rodriguez studies how animals use defensive chemicals made by plants 674

Chapter Review 675

UNIT VII Ecology

34 The Biosphere: An Introduction to Earth's Diverse Environments 678

- 34.1 Ecologists study how organisms interact with their environments at several levels 680

The Biosphere

- 34.2 The biosphere is the total of all of Earth's ecosystems 680
- 34.3 Environmental problems reveal the limits of the biosphere 681
- 34.4 Physical and chemical factors influence life in the biosphere 682
- 34.5 Organisms are adapted to abiotic and biotic factors by natural selection 683
- 34.6 Regional climate influences the distribution of biological communities 684

Aquatic Ecosystems

- 34.7 Oceans occupy most of Earth's surface 686
- 34.8 Freshwater communities occupy lakes, ponds, rivers, and streams 688

Terrestrial Ecosystems

- 34.9 The major terrestrial ecosystems are called biomes 689
- 34.10 Tropical forests cluster near the equator 690
- 34.11 Talking About Science: U.S. Forest Service scientist Ariel Lugo shares his views on tropical forest issues 691
- 34.12 Savannas are grasslands with scattered trees 692
- 34.13 Deserts are defined by their dryness 692
- 34.14 Spiny shrubs dominate the chaparral 693
- 34.15 Temperate grasslands include the North American prairie 694
- 34.16 Deciduous trees dominate temperate forests 694
- 34.17 Coniferous forests are often dominated by a few species of trees 695
- 34.18 Long, bitter-cold winters characterize the tundra 696
- Chapter Review 696

35 Population Dynamics 698

- 35.1 Populations are defined in several ways 700
- #### Population Structure and Dynamics
- 35.2 Density and dispersion patterns are important population variables 700
- 35.3 Idealized models help us understand population growth 702
- 35.4 Density-dependent and density-independent factors limit population growth 704
- 35.5 Some populations have "boom-and-bust" cycles 705
- #### Life Histories and Their Evolution
- 35.6 Life tables track mortality and survivorship in populations 706

- 35.7 Evolution shapes life histories 706

The Human Population

- 35.8 The human population has been growing very rapidly for centuries 708
- 35.9 Age-structure diagrams predict the future growth of populations 710
- 35.10 Talking About Science: Global warming may underlie geographic shifts in populations 712
- Chapter Review 712

36 Communities and Ecosystems 714

- 36.1 A community is all the organisms inhabiting a particular place 716
- #### Structural Features of Communities
- 36.2 Competition may occur when a shared resource is limited 717
- 36.3 Predation leads to diverse adaptations in both predator and prey 718
- 36.4 Predation can maintain diversity in a community 720
- 36.5 Symbiotic relationships help structure communities 720
- 36.6 Disturbance is a prominent feature of most communities 722
- 36.7 Talking About Science: Ecologist Frank Gilliam discusses the role of fire in ecosystems 723

Ecosystem Structure and Dynamics

- 36.8 Energy flow and chemical cycling are the two fundamental processes of ecosystems 724
- 36.9 Trophic structure determines ecosystem dynamics 724
- 36.10 Food chains interconnect, forming food webs 726
- 36.11 Energy supply limits the length of food chains 727
- 36.12 An energy pyramid explains why meat is a luxury for humans 728
- 36.13 Chemicals are recycled between organic matter and abiotic reservoirs 728
- 36.14 Water moves through the biosphere in a global cycle 729
- 36.15 The carbon cycle depends on photosynthesis and respiration 730

- 36.16 The nitrogen cycle relies heavily on bacteria 730
- 36.17 The phosphorus cycle depends on the weathering of rock 731
- Ecosystem Alteration**
- 36.18 Ecosystem alteration can upset chemical cycling 732

- 36.19 Altered ecosystems trigger changes in other ecosystems 733
- 36.20 Zoned reserves are an attempt to reverse ecosystem disruption 734
- Chapter Review** 734

37 Behavioral Adaptations to the Environment 736

Classical Concepts in Behavior

- 37.1 Behavioral biology is the study of how animals behave in their natural environments 738
- 37.2 Behavior results from both genes and environmental factors 739
- 37.3 Innate behavior often appears as fixed action patterns 740
- 37.4 Learning ranges from simple behavioral changes to complex problem solving 742
- 37.5 Imprinting is learning that involves both innate behavior and experience 742
- 37.6 Many animals learn by association and imitation 744
- 37.7 Innovation is problem solving without prior experience 745

Ecological Roles of Behavior

- 37.8 An animal's behavior reflects its evolution 746
- 37.9 Biological rhythms synchronize behavior with the environment 746
- 37.10 Kineses and orientation behavior place animals in favorable environments 748
- 37.11 Movement from place to place often depends on internal maps 748
- 37.12 Behavioral ecologists use cost/benefit analysis in studying feeding behavior 750

Social Behavior and Sociobiology

- 37.13 Social behavior is an important component of population biology 751
- 37.14 Rituals involving agonistic behavior often resolve confrontations between competitors 752
- 37.15 Dominance hierarchies are maintained by agonistic behavior 752
- 37.16 Talking About Science: Behavioral biologist Jane Goodall discusses dominance hierarchies and mental abilities in chimpanzees 753
- 37.17 Territorial behavior parcels space and resources 754
- 37.18 Mating behavior often involves elaborate courtship rituals 754
- 37.19 Complex social organization hinges on complex signaling 756
- 37.20 Altruistic acts can be explained by evolution 758
- 37.21 Talking About Science: Edward O. Wilson promoted the field of sociobiology and is a leading conservation activist 759
- 37.22 Culture may reinforce innate human social behavior 760
- Chapter Review** 760

38 Conservation Biology 762

The Biodiversity Crisis: An Overview

- 38.1 Habitat destruction, exotic species, and overexploitation are the major threats to biodiversity 764
- 38.2 Biodiversity is vital to human welfare 765
- 38.3 Technology and the population explosion compound our impact on habitats and other species 766
- 38.4 Rapid global warming could alter the entire biosphere 768

The Geographic Distribution of Biodiversity

- 38.5 Some locations in the biosphere are especially rich in biodiversity 770

Conservation of Species Populations

- 38.6 Conservation often centers on sustaining fragmented populations 772

- 38.7 Identifying critical habitat factors is a central goal in conservation research 773
- 38.8 Increased fragmentation threatens many populations: A case study 774

Managing and Sustaining Ecosystems

- 38.9 Sustaining ecosystems and landscapes is a conservation priority 776
- 38.10 Edges and corridors can strongly influence landscape biodiversity 777
- 38.11 Restoring degraded habitats is a developing science 778
- 38.12 Sustainable development is an ultimate goal 779

Chapter Review

Appendix 1:	Metric Conversion Table 782
Appendix 2:	The Amino Acids of Proteins 783
Appendix 3:	Further Readings 784
Appendix 4:	Chapter Review Answers 789
Appendix 5:	Photographic Credits 804
Appendix 6:	Illustration and Text Credits 808
