

Contents

Preface	v
List of Illustrations	ix
List of Plates	xiv
List of Tables	xv
1 The Principles and Techniques of Microscopy	1
Introduction Some fundamentals of microscopy Setting up the optical microscope for use Special techniques in optical microscopy Electron microscopy Summary Self-assessment questions Assignments	
2 Manipulative Techniques in the Study of the Structure and Function of Cells and Tissues	37
Introduction Making simple preparations of micro-organisms and unicellular structures Making preparations of plant and animal tissues Techniques of fixing and staining specimens for microscopic examination The Interpretation and drawing of microscope preparations Cell disruption and subcellular fractionation The importance of subcellular fractionation in understanding cell function Summary Self-assessment questions Assignments	
3 Some General Aspects of Cell Structure and Function	70
The cell concept The unit membrane: a basic building component of the cell Functional characteristics of the generalised cell Summary Self-assessment questions Assignments	
4 The Ultrastructure and Functioning of Cell Organelles	92
Subcellular components concerned with the interaction of the cell with its environment Subcellular components concerned with chemical synthesis of nucleic acids and proteins Subcellular components concerned with the acquisition and transfer of energy within the cell Subcellular components concerned with mechanical work and movement Summary Self-assessment questions Assignments	

5 Cell Division	132
The significance of cell growth and division Nuclear division: mitosis Nuclear division: meiosis Factors affecting cell division Summary Self-assessment questions Assignments Cumulative questions, Chapters 1-5	
6 Mendelian Inheritance and Other Principles of Genetics	158
The laws of inheritance A modern interpretation of Mendel's laws and their relationship to the behaviour of chromosomes in meiosis Linkage and other genetic phenomena not complying with Mendel's laws Some examples and hints for simple genetical problems Summary Self-assessment questions Assignments	
7 Some Further Aspects of Genetics and their Relationship to the Mechanism of Evolution	189
The genetic basis of variation in populations The modern concept of the gene How variation is generated Population genetics and the mechanisms of evolution Summary Appendix Self-assessment questions Assignments	
8 The Growth of Cells in vitro	240
The aims and problems of cell culture Growth media Sterilisation Aseptic techniques Summary Self-assessment questions Assignments	
9 Cell Growth and its Measurement	269
The nature and significance of cell growth The measurement of cell growth Further considerations on the techniques of counting cells The dynamics of cell growth Factors affecting growth patterns in cells Summary Self-assessment questions Assignments	
10 Concluding Remarks	305
Links between various parts of the book Other aspects of cell biology Current research trends in cell biology Conclusion Cumulative questions, Chapters 5-9	
Appendix: Answers to Numerical Questions	313
Index	317
