Chapter 1 Systems and Methods of Molecular Biology 1

A Brief Overview of Molecular Biology	1	An Outline of the Life Cycle of a	
How Molecular Biology Will Be Presented in		Phage	20
This Book	2	Phage Multiply Very Rapidly	20
The Physical Approach to Problems in		Counting Phage	21
Molecular Biology	4	Regulation of the Phage Life Cycle	22
The <i>In Vitro</i> Approach to Understanding		Infection of Bacteria with Purified Phage	
Biological Reactions	5	DNA	22
The Logic of Molecular Biology	6	Yeast	23
The Efficiency Argument	6	Animal Cells	25
Examination of Models	7	The Unnatural State of Animal Cells in	
Strong Inference	7	Culture	25
A Few Problems Studied in Molecular		Primary Cell Cultures and Established Cell	
Biology	8	Lines	27
What Isn't Molecular Biology?	10	Useful Primary Cell Cultures	28
Prokaryotes and Eukaryotes	11	Eggs and Oocytes	28
Bacteria	12	Counting Animal Cells	28
Growth of Bacteria	12	Animal Viruses	29
Counting Bacteria	14	Genera, Species, and Strains	29
Identification of Nutritional Requirements		Genetic Analysis as an Approach to Solving	
of Bacteria	15	Biological Problems	30
The Physical Organization of a		Genetic Notation, Conventions, and	
Bacterium	16	Terminology	30
Metabolic Regulation in Bacteria	17	Mutants	32
Bacteriophage	18	The Number of Mutations in a Mutant	33
Phage Structures	19	Revertants and Reversion	33

Uses of Mutants: Some Examples	35
Genetic Analysis of Mutants	38
Genetic Recombination	38
Genetic Mapping	39
Linkage and Multifactor Crosses	41
Complementation	42
Complementation Analysis: An Example	43
Complementation in Phage-Infected Bacteria	45

Genetic Systems in Bacteria	46
Hfr Cells	47
Genetic Mapping by an Hfr $\times$ F ⁻ Mating	48
The Circular Genetic Map of <i>E. coli</i>	50
<i>E. coli</i> Recombination Genes	50
F' Plasmids	50
References	51

Chapter 2 The Basics of Biochemistry 53

The Molecules of Biological Systems	54
Functional Groups and Bond Types	54
Major Classes of Organic Compounds in Biochemistry	56
Components of Proteins	58
Pyrimidines and Purines—Components of Nucleic Acids	58
Macromolecules	59
Nutritional Requirements of Cells	61
Nutritional Requirements of Bacteria	61
Lack of Precipitation of Insoluble Ionic Compounds	62
Factors Affecting the Growth Rate of Bacteria	63
Nutritional Requirements of Algae, Yeasts, and Protozoa	64

Nutritional Requirements of Animal Cells	64
Metabolism and Biochemical Pathways	65
Enzymes	65
Degradative and Biosynthetic Reactions	65
Multistep Pathways	66
Energetics of Degradative and Biosynthetic Pathways	66
Energy Metabolism and Storage: ATP	67
Synthesis of ATP	68
Utilization of the Energy of ATP	72
Elucidation of Metabolic Pathways	73
References	74

Chapter 3 Macromolecules 76

Chemical Structures of the Major Classes of Macromolecules	77
Proteins	77
Nucleic Acids	80
Polysaccharides	83
Noncovalent Interactions That Determine the Three-Dimensional Structures of Proteins and Nucleic Acids	83
The Random Coil	83
Hydrogen-bonding	84
The Hydrophobic Interaction	84
Ionic Bonds	86
Van Der Waals Attraction	86
Summary of the Effects of Noncovalent Interactions	87

Methods Used to Study Macromolecules	88
Velocity Sedimentation	88
Equilibrium Centrifugation	90
Electrophoresis	91
Electron Microscopy	93
Determination of the Molecular Weight of a Macromolecule	97
Determination of <i>M</i> for DNA Molecules	97
Measurement of the Molecular Weight of Proteins	99
References	100

Chapter 4 Nucleic Acids 101

Physical and Chemical Structure of DNA	101
Base-pairing and the DNA Double Helix	101
Antiparallel Orientation of the Two Strands of DNA	104
Variation of Base Composition of the DNA of Different Organisms	105
Forms of the DNA Helix	106
The Size of DNA Molecules	106
Fragility of DNA Molecules	107
The Factors That Determine the Structure of DNA	108
Denaturation and Melting Curves	108
Evidence for Hydrogen Bonds in DNA	110
Evidence for Hydrophobic Interactions in DNA	111
Base-stacking	112
Cooperativity of Base-stacking	113
Effect of the Ionic Strength of the Solution on the Structure of DNA	115
Fluctuation of the Structure of the DNA Molecule	115
Denaturation and Strand Separation	116
Denaturation of DNA by Helix-destabilizing Proteins	118
Denaturation of DNA in Alkali	119
Structure of Denatured DNA	119

Renaturation	120
Requirements for Renaturation	121
Mechanism of Renaturation	121
Hybridization of DNA of Different Organisms	122
Filter-binding Assays for Renaturation	123
Concentration Dependence of Renaturation: C_{0t} Curves	124
DNA Heteroduplexes	128
Circular and Superhelical DNA	130
Twisted Circles	131
Single-Stranded Regions in Superhelices	131
The Origin of Supercoiling	132
Experimental Detection of Covalently Closed Circles	132
Experimental Detection of Superhelicity	135
The Structure of RNA	136
Hydrolysis of Nucleic Acids	137
Polynucleotide Kinase, a Useful Enzyme	139
Radioactive Labeling of Nucleic Acids	140
Sequencing Nucleic Acids	141
Left-Handed DNA Helices	145
Satellite DNA	148
References	149

Chapter 5 The Physical Structure of Protein Molecules 151

Sizes of Protein Molecules	151
Structure of a Polypeptide Chain	152
Folding a Polypeptide Chain	152
Hydrogen Bonds and the α Helix	155
β Structures	158
Fibrous and Globular Proteins	159
Binding Sites of Proteins	162
Proteins with Subunits	164
A Few Means of Studying Protein Structure	166
Denaturation of Proteins	166
Renaturation of Proteins	167
Hydrolysis of Proteins	168
Determination of the Amino Acid Sequence of a Protein	169
Regulation of the Activity of Proteins	169
End-Product Inhibition	169
Regulation of Multisubunit Proteins—Allostery	170
Two Mechanisms for Allosteric Modulation	171

An Allosteric Enzyme: Aspartyl Transcarbamoylase	173
A Complex Protein: Immunoglobulin G	175
Enzymes	179
The Enzyme-Substrate Complex	180
Theories of Formation of the Enzyme-Substrate Complex	181
Molecular Details of an Enzyme-Substrate Complex	183
Dissociation of an Enzyme-Substrate Complex: Turnover	184
Detection of Enzymatic Activity	184
Optical Assays of Enzyme Activity	185
Radioactivity Assay for Enzymes	186
Detection of Enzymatic Activity in a Crude Extract	186
Preparation of Radioactive Proteins	186
References	188

Chapter 6 Macromolecular Interactions and the Structure of Complex Aggregates 189

Collagen—A Multiprotein Assembly	190	The Binding of the Cro Protein of Phage λ to DNA	206
Amino Acid Composition and Sequence of Collagen	190	Biological Membranes	212
Tropocollagen—A Triple-Stranded Helical Unit	192	Roles of Membranes in Biological Systems	212
Interaction of Tropocollagen Units to Form a Fiber	193	Membrane Structure: The Basic Bilayer	213
A Complex DNA Structure: The <i>E. coli</i> Chromosome	196	Vesicles	215
Interaction of the DNA with a Scaffold Protein	196	Modulation of the Basic Bilayer Structure: Permeability and Transport	217
A Multiply-Looped DNA Structure	197	The Bacterial Cell Wall	220
Chromosomes and Chromatin	199	Multiple Layers in the Cell Wall	220
Histones and Chromatin	200	The Peptidoglycan Layer	220
The Structural Hierarchy of Chromosomes	201	The Inner Membrane and Permeability	223
Nucleosomes	201	The Outer Membrane: Lipopolysaccharides, Lipoprotein, and Porin	224
Assembly of Nucleosomes—The 30-nm Fiber and the Solenoidal Model of Chromosomal Structure	205	The Periplasmic Space	226
Interaction of DNA and a Protein That Recognizes a Specific Base Sequence	206	Osmotically Fragile Cells	226
		Self-assembly of Complex Aggregates	227
		Assembly of Tobacco Mosaic Virus	227
		References	229

Chapter 7 The Genetic Material 231

The Central Dogma	232	Storage and Transmission of Genetic Information by DNA	243
The Genetic Code and the Adaptor Hypothesis	232	Transmission of Information from Parent to Progeny	244
Identification of DNA as the Genetic Material	234	Chemical Stability of DNA and Its Information Content	245
The Transformation Experiments	234	The Ability of DNA to Change: Mutation	247
The Chemical Experiments	239	RNA as a Genetic Material	249
The Blender Experiment	239	References	249
The Question of RNA as a Genetic Substance	242		
Properties of the Genetic Material	243		

Chapter 8 DNA Replication 251

The Basic Rule for Replication of All Nucleic Acids	252	Geometry of the Replication of Circular DNA Molecules	258
The Geometry of DNA Replication	252	Mechanism of Action of DNA Gyrase	262
The Semiconservative Replication of Double-Stranded DNA	253	Enzymology of DNA Replication	266
The Meselson-Stahl Experiment	255	The Polymerization Reaction and the Polymerases	266
The Geometry of Semiconservative Replication	257	Source of the Precursors	268
		Properties of Polymerases I and III	269

The Direction of Chain Growth	276
DNA Ligase	276
Discontinuous Replication	277
Fragments in the Replication Fork	277
Detection of Fragments	279
Uracil Fragments	280
The RNA Terminus of Precursor Fragments	284
Joining Precursor Fragments	284
Events in the Replication Fork	286
Advance of the Replication Fork and the Unwinding of the Helix	286
Initiation of Replication from a Single-Stranded Template: Initiation of Precursor Fragments	289
A Summary of the Events at the Replication Fork	290
Initiation of Synthesis of the Leading Strand	293

De Novo Initiation in <i>E. coli</i>	294
D Loops	294
Initiation by Covalent Extension—Rolling Circle Replication	296
Bidirectional Replication	299
Termination of Replication	303
Termination of Replication of a Circle	303
Termination of Phage T7 DNA, a Linear DNA Molecule	304
Methylation of DNA and Mismatch Repair	306
Regulation of Bacterial DNA Synthesis and Reinitiation of a Partially Replicated DNA Molecule	307
Replication of Eukaryotic Chromosomes	309
Multiple Forks in Eukaryotic DNA	309
Replication of Chromatin	310
References	314

✓ Chapter 9 DNA Repair 316

Alterations of DNA Molecules	316
Biological Indication of Repair	320
Identification of the Thymine Dimer as a Primary Lesion That Is Repairable	322
Biochemical Mechanisms for the Repair of Thymine Dimers	323
Photoreactivation	323
Excision Repair	324

Recombinational Repair	326
SOS Repair	330
Summary of the Repair of Thymine Dimers	333
Repair of Cross-Links	335
Repair of Damage by Ionizing Radiation	337
Why Do Damaged Cells Die?	338
References	338

✓ Chapter 10 Mutagenesis, Mutations, and Mutants 339

Terminology	339
Types of Mutations and Notations Used	341
Isolation of Mutants	342
Detection of Mutants	342
Enrichment for Mutants	345
Detection of Mutants in Diploid Cells	345
Biochemical Basis of Mutants	347
Mutagenesis	348
Base-Analogue Mutagens	349
Chemical Mutagens	353
Ultraviolet Irradiation	355
Mutagenesis by Intercalating Substances	355
Mutagenesis by Insertion of Long Segments of DNA (Transposable Elements)	356

Mutator Genes	357
Mutational Hot Spots	357
Deletions, Duplications, and Rearrangements	359
Reversion	361
Detection of Revertants	361
Second-Site Revertants	361
Second-Site Revertants of Frameshift Mutations	364
Reversion at the Mutational Site Stimulated by Mutagens	365
Extragenic Reversion	365
Reversion as a Means of Detecting Mutagens and Carcinogens	366
References	367

Chapter 11 Transcription 369

Enzymatic Synthesis of RNA	370
Basic Features of RNA Synthesis	370
<i>E. coli</i> RNA Polymerase	373
Site Selection: I. The Promoter	375
Site Selection: II. The Pribnow Box	377
Site Selection: III. The -35 Sequence	377
Site Selection: IV. The CAP Site	379
RNA Chain Initiation	381
Chain Elongation	382
Termination and Release of Newly Synthesized RNA	383
Classes of RNA Molecules	389
Structure of Messenger RNA	389
Lifetime of mRNA	391
Stable RNA: Ribosomal RNA and Transfer RNA	393
Processing of tRNA Molecules	394
Processing of Ribosomal RNA in <i>E. coli</i>	398

Summary of Processing in Prokaryotes	399
Transcription in Eukaryotes	400
RNA Polymerases of Eukaryotes	401
Structure of 5' and 3' Termini of Eukaryotic mRNA Molecules: "Caps" and "Tails"	402
RNA Splicing	404
The Transcription Unit Concept	410
Eukaryotic rRNA Molecules	411
Formation of Eukaryotic tRNA Molecules	412
Means of Studying Intracellular RNA	414
Separation of RNA Molecules	414
DNA-RNA Hybridization	415
The Southern Transfer Procedure	423
References	425

Chapter 12 Translation: I. The Informational Problem 426

Outline of Translation	426
The Genetic Code	428
Two Types of Codes	428
A Genetic Argument for a Triplet Code	428
Elucidation of the Base Composition of the Codons	433
Elucidation of the Base Sequence of the Codons	435
Identification of the Stop Codons	436
Identification of the Start Codons	438
Universality of the Code	438
Redundancy of the Code	438
Genetic Confirmation of Codon Assignments	440
The Decoding System	440
Transfer RNA and the Aminoacyl Synthetases	440
The Cloverleaf Structure of tRNA	441
Three-Dimensional Structure of tRNA	443
Attachment of an Amino Acid to a tRNA Molecule	446
The Aminoacyl Synthetases	447
Recognition of a tRNA Molecule by Its Cognate Synthetase	448
Error Correction in Aminoacylation	450
The Codon-Anticodon Interaction	451
Presence of Inosine in the Anticodon Loop	452

Redundancy as a Response of One Anticodon to Several Codons: The Wobble Hypothesis	453
Stability of the Codon-Anticodon Interaction	456
Minor tRNA Molecules	457
The Special Properties of the Prokaryotic Initiator tRNA ^{Met}	457
Transfer RNA Genes	459
Suppressors	461
Genetic Detection of a Nonsense Suppressor	461
Nonsense Suppressor tRNA	462
Biochemical Features of Nonsense Suppression	462
Normal Termination in the Presence of a Suppressor tRNA	465
Suppression of Missense Mutations	467
Missense Suppression Caused by an Altered Anticodon	467
Missense Suppression by Mischarging of a Mutant tRNA	468
Mutant Synthetases as Suppressors	469
Frameshift Suppressors	469
Temperature-Sensitive (Ts) Suppressors	471
Suppressor-enhancing Mutations	471
Suppressors in Yeast and Their Use in Animal Cell Research	471
