

This book includes synopses of invited symposium papers, abstracts of workshop papers and abstracts of contributions to poster sessions. Synopses of symposium papers (S) are arranged in order of presentation. Under their subject title, abstracts of workshop papers (W) are arranged in order of presentation followed by the abstracts of posters (P) in alphabetic order of first author.

# SYMPOSIA

|                                                                                  |    |
|----------------------------------------------------------------------------------|----|
| 1. The taming of the viruses                                                     | 1  |
| 2. Molecular mechanisms in viral oncogenesis                                     | 15 |
| 3. The ecology of viruses: the struggle of the genes                             | 27 |
| 4. Structure and assembly of viral particles                                     | 39 |
| 5. Pathogenesis of viral infections                                              | 51 |
| 6. Organization of viral genomes in relation to their replication and expression | 59 |

# WORKSHOPS (papers and posters)

|                                                                                                 |     |
|-------------------------------------------------------------------------------------------------|-----|
| 1. Specific mechanisms of antiviral resistance; viruses and the immune system                   | 69  |
| 2. Non-specific viral defence mechanisms; interferon                                            | 93  |
| 3. Perspectives of newer viral vaccines                                                         | 115 |
| 4. Perspectives of antiviral chemotherapy                                                       | 123 |
| 5. Clinical virology                                                                            | 135 |
| 6. Viral pollution of the environment                                                           | 149 |
| 7. Congenital infections; congenital malformations                                              | 157 |
| 8. Viruses of fungi and mycoplasmas                                                             | 169 |
| 9. Early stages of virus-cell interactions                                                      | 177 |
| 10. Virus structure and assembly                                                                | 187 |
| 11. Membrane involvement in virus replication                                                   | 203 |
| 12. Mechanisms of persistent viral infections; slow viruses                                     | 215 |
| 13. Defective particles in the regulation of infection; interference phenomena in rhabdoviruses | 235 |
| 14. Mechanisms of integration of viral DNA into host genomes (animals, micro-organisms)         | 245 |
| 15. Molecular aspects of virus variation                                                        | 251 |

|                                                                                                        |     |
|--------------------------------------------------------------------------------------------------------|-----|
| 16. Multiplication of plant viruses in protoplasts                                                     | 259 |
| 17. Symptomatology and pathogenesis in virus-infected plants                                           | 269 |
| 18. Vertebrate and plant viruses in their arthropod vectors                                            | 277 |
| 19. Ecology of vector-borne viruses (plant and vertebrate) and epidemiology of the diseases they cause | 283 |
| 20. Organization of seed and serum banks and their application to virus identification and research    | 291 |
| 21. Replication and transcription of negative strand viruses                                           | 297 |
| 22. Replication of small RNA viruses of animals and plants                                             | 309 |
| 23. Replication of Reoviridae                                                                          | 329 |
| 24. Myxoviruses and paramyxoviruses                                                                    | 339 |
| 25. RNA tumor viruses: replication and genetics                                                        | 355 |
| 26. RNA tumor viruses: evolution, ecology and detection                                                | 371 |
| 27. Bacteriophages of genera other than Escherichia                                                    | 385 |
| 28. Viral hepatitis: new developments                                                                  | 389 |
| 29. Animal and plant rhabdoviruses: ecology; transmission; structural characteristics                  | 401 |
| 30. Bunyaviridae: ecology; transmission; structural characteristics                                    | 411 |
| 31. Togaviridae: ecology; transmission; structural characteristics                                     | 423 |
| 32. Non-arthropod-borne togaviruses                                                                    | 439 |
| 33. Arenaviruses: ecology; transmission; structural characteristics                                    | 441 |
| 34. Coronaviruses: ecology; transmission; structural characteristics                                   | 447 |
| 35. Aspects of gastroenteritis viruses                                                                 | 457 |
| 36A. Adenoviruses: replication and genetics                                                            | 473 |
| 36B. Papovaviruses: replication and genetics                                                           | 483 |
| 37. Papovaviruses and adenoviruses: transcription; translation; transformation                         | 489 |
| 38A. Herpesviruses: replication                                                                        | 501 |
| 38B. Herpesviruses: transformation; oncogenesis; immunology                                            | 513 |
| 39. Parvoviruses                                                                                       | 531 |
| 40. Iridoviruses                                                                                       | 539 |
| 41. Poxviruses of vertebrates and invertebrates                                                        | 547 |
| 42. Baculoviruses                                                                                      | 559 |
| 43. Small RNA viruses of insects                                                                       | 569 |
| 44. Viroids                                                                                            | 575 |
| 45. Potyviruses                                                                                        | 583 |
| 46. RNA phages                                                                                         | 589 |
| 47. Double-stranded and single-stranded DNA phages                                                     | 595 |
| 48. Bacteriophages associated with lysogeny                                                            | 607 |
| 49. Evolution of viruses                                                                               | 615 |
| 50. Rapid diagnosis                                                                                    | 625 |
| 51. Miscellanea                                                                                        | 641 |
| List of contributors                                                                                   | 653 |
