

Contents

1	Life and Plants	1
	An introduction to botany and to science in general.	
2	Use of Plants by Humans	14
	A brief discussion of how some plants or plant parts are used by humans.	
3	A Few Basic Physical and Chemical Principles	27
	The general principles that will be an aid to the understanding of plant functions, forms of energy, light.	
4	Cell Structure	45
	The basic structure of a cell and cell division; chromosome duplication.	
5	Diffusion and the Entrance of Materials into Cells	77
	The movement of materials into and out of cells, water potential, osmosis, and plasmolysis; active absorption.	
6	The Plant	94
	The general appearance of plants, meristematic tissues, and simple permanent tissues.	
7	Stem Structure	106
	The general structure and development of various kinds of stems and the individual cells that comprise primary and secondary tissues.	

8 Stem Function	130
The movement of organic materials and water in stems, modified stems, grafting, rooting, and economic uses of stems.	
9 Roots	143
Types of root systems, the development of tissues that comprise the roots, absorption of materials, and the economic uses of roots.	
10 Leaves	161
The basic structure of leaves, their modifications and economic importance; abscission.	
11 Energy, Enzymes, and Digestion	174
Bond energy, activation energy, and free energy; exergonic and endergonic reactions; enzyme characteristics and mechanism of action; and types of digestions.	
12 Photosynthesis	187
Nutritional types of organisms; the process of photosynthesis (light and dark reactions, C_3 and C_4 pathways, CAM); photorespiration; limiting and retarding factors; the use of radioactive isotopes; amounts of carbon fixed.	
13 Synthesis and Respiration	214
Respiration and fermentation reactions (glycolysis, pentose phosphate pathway, Krebs cycle, and terminal oxidations), energy transfers, and cellular syntheses.	
14 Correlation of Processes, Plant Distribution, and Food Chains	238
Compensation points and plant distribution, food chains, energy conversions and carbon cycle, and carnivorous plants.	
15 Transpiration and Plant Distribution	255
Water requirements, factors influencing transpiration, rainfall and plant distribution, erosion and the Dust Bowl.	
16 Mineral Nutrition	277
Essential elements and their functions, mineral absorption, hydroponics, and organic farming.	

17	Soils	287
	The formation, characteristics, texture, and structure of soils; soil moisture; soil groups.	
18	Inheritance and Variation	303
	Meiosis, and genetic principles; linkage and crossing-over, multiple alleles and genes, lethal genes; extranuclear inheritance; hybrid vigor; gene function.	
19	Plant Classification	347
	Classification, types of reproduction, alternation of phases, and general characteristics of plant groups.	
20	Kingdom Monera	365
	Monera; Division Cyanophyta (blue-green algae) and Schizophyta (bacteria); recombination in bacteria; diseases, decay, sulfur and nitrogen conversions, sewage disposal, and commercial uses of bacteria.	
21	Division Eumycota	387
	Eumycota (true fungi); Classes Phycomycetes (<i>Saprolegnia</i> and <i>Rhizopus</i>), Ascomycetes (<i>Saccharomyces</i> , <i>Peziza</i> , <i>Morchella</i> , <i>Aspergillus</i> , and <i>Penicillium</i>), Basidiomycetes (<i>Agaricus</i> , <i>Fomes</i> , and <i>Lycoperdon</i>), and Lichens; plant diseases; mycorrhiza; characteristics and importance of each group.	
22	Algal Groups	410
	Divisions Cholorphyta (<i>Chlamydomonas</i> , <i>Ulothrix</i> , <i>Ulva</i> , <i>Pandorina</i> , <i>Oedogonium</i> , and <i>Spirogyra</i>), Chrysophyta (diatoms), and Phaeophyta (<i>Ectocarpus</i> , <i>Laminaria</i> , and <i>Fucus</i>); characteristics and importance of each group.	
23	Division Bryophyta	430
	Bryophyta; Classes Musci (mosses) and Hepaticae (liverworts; thalloid and leafy types); characteristics.	
24	Vascular Plants: Divisions Psilophyta, Lycophyta, and Sphenophyta	441
	Psilophyta (<i>Psilotum</i>), Lycophyta (<i>Lycopodium</i> and <i>Selaginella</i>), Sphenophyta (<i>Equisetum</i>), and origin of land flora; characteristics and importance of each group.	

25	Division Pterophyta	455
	Pterophyta (ferns); characteristics and importance.	
26	Division Coniferophyta	463
	Coniferophyta (pines and relatives), characteristics; <i>Pinus</i> , cones and seeds; economic importance of the Coniferophyta.	
27	Division Anthophyta	474
	Anthophyta (flowering plants), characteristics; flower structure and function, pollination, seed, fruit and its modifications, seed dispersal and dormancy; economic uses of Anthophyta.	
28	Evolution	504
	Evidence of evolution; Lamarck, Darwin, de Vries; evolution in the plant kingdom.	
29	Growth, Development, Flowering, and Plant Movements	530
	Growth regulators and their effects; auxins, phototropism, geotropism, gibberellins, cytokinins, ethylene, abscisic acid; photoperiodism, vernalization; phytochrome; photomorphogenesis; turgor and growth movements.	
30	Our Environment	565
	Vegetation types; primary and secondary plant succession, climax; land and water utilization.	
31	Populations and Their Problems	592
	Population increase, food supply, standard of living, possible solutions to population problems.	
32	Pollution	621
	Effect of technology; litter; water pollution (sewage, industrial discharges, fertilizers and pesticides, irrigation and salt accumulation); air pollution (SO ₂ , F, PAN, ozone); effect on plants and human health.	
33	The Beginning	634
	The origin of life, autotroph hypothesis, heterotroph hypothesis, spontaneous generation.	

Glossary	641
Appendix: Units of Measurement.	656
