Foreword	page vii
Acknowledgements	viii
List of tables	xi
List of contributors	xi
1 Techniques in cell biology B. King	1
1.1 Introduction	2
1.2 Light microscopy	2
1.3 Contrast techniques	4
1.4 Electron microscopy	9
1.5 Cell and tissue separation techniques	12
1.6 Chromatography	15
1.7 Electrophoresis	19
1.8 Radioactive techniques	20
1.9 X-ray diffraction	27
2 Evolution of cells M. A. Sleigh	31
2.1 The essential characteristics of cells	32
2.2 Origin and evolution of early cells	35
2.3 Prokaryotes: archaeobacteria and eubacteria	39
2.4 Evolution of energy metabolism among prokaryotes	40
2.5 Cellular features of prokaryotes	47
2.6 Cell organisation in eukaryotes	51
2.7 The origin of eukaryotes	55
2.8 Symbiotic organelles in eukaryotes	56
2.9 Some variants of cellular features in eukaryotes	58
2.10 Cellular evolution amongst eukaryotes	65
References and further reading	68
3 Enzymes C. J. Wynn	71
3.1 Role of enzymes	72
3.2 Levels of protein structure	73
3.3 Enzyme specificity	81
3.4 Mechanism of enzyme action	89
3.5 Control of enzyme action	100
3.6 Trends in research	107
References and further reading	110

4	Membranes	<i>G. E. Jones</i>	113
4.1	Membrane structure		114
4.2	Membrane transport		122
4.3	Cell junctions		130
4.4	Cellular recognition and adhesion		132
4.5	Trends in research		136
	References and further reading		140
5	Molecular basis of heredity	<i>M. R. Hartley</i>	143
5.1	Molecular biology		144
5.2	The structure of nucleic acids		148
5.3	Replication of DNA		154
5.4	Complexity and organisation of DNA		161
5.5	Structure of the nucleus		169
5.6	Gene cloning		171
5.7	DNA sequencing		178
5.8	Trends in research		180
	References and further reading		180
6	The synthesis of RNA and protein	<i>M. R. Hartley</i>	183
6.1	Introduction		184
6.2	The different classes of cellular RNA		186
6.3	The synthesis of RNA		191
6.4	Transcriptional control in prokaryotes		194
6.5	Post-transcriptional modification of RNA		195
6.6	Reverse transcription		198
6.7	Genetic code		199
6.8	The mechanism of protein synthesis		203
6.9	Trends in research		211
6.10	Applications of recombinant DNA technology		214
	References and further reading		220
7	Cellular motility	<i>G. E. Jones</i>	223
7.1	Microtubules, microfilaments and intermediate filaments		224
7.2	Microfilament-based motility		224
7.3	Microfilaments in non-muscle cells		234
7.4	Microtubule-based motility		242
7.5	Flagella and cilia		247
7.6	Bacterial flagella		250
7.7	Trends in research		251
	References and further reading		255
	Glossary		256
	Index		258

List of tables

1.1	Sedimentation coefficients	13
1.2	Biologically useful isotopes	20
2.1	Standard redox potentials of some redox pairs important in cell biochemistry	41
5.1	Growth of mutant strains of <i>Neurospora</i>	145
5.2	Some of the enzymes involved in DNA replication in <i>Escherichia coli</i>	158
5.3	C values (haploid DNA content in base pairs) of various groups of organisms	162
5.4	Some properties of bovine histones	164
5.5	Sources and cleavage/recognition sequences of some commonly used restriction endonucleases	172
6.1	Properties of eukaryotic RNA polymerases	193
6.2	The genetic code	202
6.3	Allowed base-pairing combinations according to the wobble hypothesis	203
6.4	Some common genetic diseases	218

List of contributors

M. R. Hartley, Department of Biology, University of Warwick, Coventry, CV4 7AL, UK

G. E. Jones, Department of Biology, Queen Elizabeth and Kings College, London, W8 7AH, UK

B. King, Biology Department, Stowe School, Buckingham, MK18 5EH, UK

M. A. Sleight, Department of Biology, University of Southampton, Southampton, SO9 3TU, UK

C. H. Wynn, Department of Biochemistry, University of Manchester, Manchester, M13 9PL, UK
