SECTION 1 GENE IDENTIFICATION

1 Classical mutagenesis in higher plants 1

Maarten Koornneef

- 1 Introduction 1
- 2 General principles and nomenclature 2
- 3 Choices in a mutagenesis experiment 4
 - Parental genotypes 4
 - Choice of mutagens 4
 - Mutagen dose 6
 - Numbers of M1 and M2 plants 8
 - The handling of M1 plants 9
- 4 Further analysis of mutants 9
- References 10

2 Plant transformation 13

Karabi Datta and Swapan K. Datta

- 1 Introduction 13
 - Embryogenic culture and recalcitrance 14
- 2 *Agrobacterium*-mediated transformation 15
 - Agrobacterium-tumefaciens* and the Ti plasmid 15
 - Vector systems for *Agrobacterium*-mediated transformation 15
 - Supervirulent strains and superbinary vectors 16
 - Transformation using *Agrobacterium* as a vector 16
- 3 Transformation by biolistic method 20
 - Biolistic transformation 23
- 4 Protoplast transformation 25
 - Protoplast transformation using polyethylene glycol (PEG) 26
- 5 Conclusions 28
- 6 Acknowledgements 28
- References 30

3 T-DNA tagging 33

Csaba Koncz and Jeff Schell

- 1 Introduction 33
- 2 Generation of T-DNA transformants 34
 - The mechanism of T-DNA transformation 34
 - Agrobacterium* hosts 34
- 3 T-DNA tagging in *Arabidopsis* 35
 - Generation of transformants 35
- 4 Screening approaches and theoretical considerations 43
 - Phenotype-based screening 43
 - Reverse genetics using sequence-based PCR screening approaches 45
 - Identification of gene mutations using sequenced T-DNA tags 46
- References 49

4 Transposon tagging methods in heterologous plants 53

Andy Pereira

- 1 Introduction 53
- 2 Generation of lines for transposon tagging 54
 - Phenotypic excision assays 54
 - Autonomous *Ac* systems 58
 - Two-Component *Ac-Ds* tagging systems 59
 - En-I(Spm)* tagging systems 61
- 3 Mapping transposon lines 62
- 4 Transposon tagging strategies 65
 - Random and targeted tagging 65
 - Entrapment with transposons 67
 - Chromosomal engineering 69
- 5 Isolation of tagged genes 69
 - Proof that a gene has been tagged 69
 - Cloning a tagged gene 71
- 6 Reverse genetics strategies to identify mutants 75
 - Target selected gene inactivation 75
 - Sequencing of transposon flanking DNA to identify tagged genes 77
- References 78

5 Cloning plant genes by genomic subtraction 83

Tai-ping Sun

- 1 Introduction 83
- 2 The genomic subtraction technique 85
- 3 Deletion mutagenesis 85
- 4 Genomic subtraction protocol for *Arabidopsis* 87
 - Preparation of genomic DNA from wild-type and putative deletion mutants 87
 - Subtractive hybridization 90
 - Amplification and cloning of the DNA fragments after subtraction 91
 - Screening the clones corresponding to deletion mutations 93
 - Leak through background clones 95
 - Pilot experiments 96

- 5 Comparison of genomic subtraction to representational difference analysis (RDA) 97
- Acknowledgments 98
- References 98

SECTION 2 GENE ORGANIZATION

6 Approaches to gene mapping 101

S. Grandillo and T. M. Fulton

- 1 Introduction 101
- 2 Molecular mapping: an overview 102
 - Principles of linkage analysis 102
 - Molecular markers and genetic maps 103
 - Choice of mapping populations 104
 - Population size 105
 - Tagging genes with tightly linked markers 106
 - Gene mapping in two model plant species 107
 - Relationship between genetic and physical maps 110
- 3 Isolation of genomic DNA from plant tissue 111
- 4 Restriction fragment length polymorphism (RFLP) analysis 114
 - Restriction enzyme digestion and gel electrophoresis 115
 - Southern blotting 117
 - Preparation of nucleic acid probes 119
 - Hybridization analysis of Southern blots 122
- 5 Random amplified polymorphic DNA (RAPD) analysis 123
- 6 Principles of amplified fragment length polymorphism (AFLP) analysis 125
- 7 PFGE in physical mapping of plant genomes 127
 - Preparation of large fragment DNA from plant nuclei 128
 - Restriction digestion of agarose-embedded DNA 130
 - PFGE analysis 132
- Acknowledgments 134
- References 134

7 Arabidopsis YAC, BAC and cosmid libraries 137

Paul Muskett, Ian Bancroft and Caroline Dean

- 1 Introduction 137
- 2 YAC libraries 137
 - Screening of YAC libraries by colony hybridization 139
 - Preparation of intact yeast chromosomes 141
- 3 BAC libraries 143
 - Construction of BAC libraries 144
 - Screening of BAC libraries using colony hybridizations 148
- 4 Cosmid libraries 152
 - Construction of a cosmid library using pCLD04541 153
- References 156

CONTENTS

8 *In situ* hybridization to plant chromosomes and DNA fibres 159

J. S. Heslop-Harrison and Trude Schwarzacher

- 1 Introduction 159
- 2 Preparation of targets 160
 - Sources of material 160
 - Chromosome spread preparation 162
 - Extended DNA fibres 163
- 3 Probes and labels 165
 - The nature of probes 165
 - Cloned DNA sequences 165
 - PCR products 166
 - Total genomic DNA for chromosome and genome painting 166
 - Synthetic oligonucleotide sequences 167
 - Probe labelling and purification 167
 - Testing label incorporation and quality control of probes 168
 - Fluorochromes 168
- 4 The hybridization mixture, stringency and denaturation 169
 - Pretreatments of chromosome preparations 169
 - The hybridization mixture 170
 - Setting up the hybridization 172
 - Stringent washes 173
- 5 Fluorescent detection and visualization of hybridization sites 174
 - Detection of hybridization sites of indirect labels 174
 - Counterstaining and mounting 175
 - Visualization and imaging 176
- 6 Conclusions 177
- References 178

SECTION 3 LIBRARY SCREENING AND cDNA ISOLATION

9 PCR cloning approaches 179

Michiel Vandenbussche and Tom Gerats

- 1 Introduction 179
- 2 RNA fingerprinting methods 180
 - Differential display 180
 - cDNA-AFLP 180
 - Obtaining full length cDNA clones: RACE-PCR 183
- 3 Multigene family cloning by the FamilyWalker method 183
 - Introduction 183
 - The FamilyWalker strategy 184
 - Design of degenerate primers 187
 - Primer design 188
 - PCR optimization 190
 - Amplifying new *Petunia hybrida* MADS-box genes by the FamilyWalker method 193
- Acknowledgments 203
- References 203

10 Western and south-western library screens 205*Rhonda C. Foley and Karam B. Singh*

- 1 Introduction 205
- 2 Working with cDNA expression libraries 206
- 3 Preparation of nitrocellulose filters 208
- 4 Western cDNA library screening 209
 - Polyclonal and monoclonal antibodies 209
 - Detection systems used in western library screening 210
 - Characterization of clones isolated by western library screening 213
- 5 South-western screening approach 213
 - Preparing the DNA probe for south-western screening 214
 - Preparation of nitrocellulose filters for south-western screening 216
 - Using proteins that have been denatured/renatured for south-western screening 216
 - Screening the cDNA library for DNA binding proteins 217
 - Selection of positive phage 218
- 6 Characterization of clones isolated by south-western screening 219
- References 220

11 Complementation cloning 223*E. Ann Oakenfull and James A. H. Murray*

- 1 Introduction 223
- 2 General requirements for complementation cloning 226
 - Choice of mutant strain and selection strategy 226
 - Choice of cDNA library and vector 230
 - Transformation efficiency 233
- 3 Preparation of cDNA libraries and mutant strains for complementation cloning 233
 - Amplification of plasmid cDNA libraries 233
 - Optimizing growth conditions of the mutant strain 236
- 4 Transformation and screening in *E. coli* 236
 - Transformation 236
 - Screening 236
- 5 Transformation and screening in *S. cerevisiae* 237
 - Transformation 237
 - Screening 239
- 6 Potential Problems 242
- 7 Conclusions 243
 - Acknowledgements 244
 - References 244
