

# Table of Contents

|                                                           |    |
|-----------------------------------------------------------|----|
| I. INTRODUCTION .....                                     | 1  |
| II. BIOMOLECULAR INFORMATION .....                        | 3  |
| 1. <i>The Code and its Origins</i> .....                  | 5  |
| Prebiotic Stage .....                                     | 6  |
| Environmental Conditions .....                            | 6  |
| Synthesis of Amino Acids .....                            | 6  |
| Polymerization of Amino Acids .....                       | 8  |
| Formation of Nucleotides .....                            | 11 |
| Self-Organization .....                                   | 13 |
| Coacervates .....                                         | 15 |
| Protocells .....                                          | 16 |
| Evolution .....                                           | 16 |
| Selection .....                                           | 18 |
| Complementarity .....                                     | 23 |
| Mutability vs. Recognition .....                          | 24 |
| The Genetic Code .....                                    | 26 |
| Molecular Characteristics .....                           | 27 |
| Duplication and Transcription .....                       | 38 |
| Transmission of the Code .....                            | 39 |
| Protein Synthesis .....                                   | 40 |
| Sequences and Conformations .....                         | 44 |
| Information and Recognition .....                         | 57 |
| III. MOLECULAR INFORMATION THEORY .....                   | 59 |
| 2. <i>Recognition Processes</i> .....                     | 61 |
| Definitions and Conventions .....                         | 61 |
| Probability of Recognition .....                          | 62 |
| Stabilization Energy .....                                | 64 |
| Conditions for Recognition .....                          | 66 |
| Characteristics of the Interacting Sites .....            | 66 |
| Influence of the Concentrations .....                     | 71 |
| The Determination of Stabilization Energies .....         | 72 |
| Solvation Effects .....                                   | 73 |
| Reference States .....                                    | 74 |
| Topological Characteristics of Energy Hypersurfaces ..... | 76 |
| 3. <i>Interaction Energies</i> .....                      | 79 |
| General Outline .....                                     | 79 |
| Bimolecular Associates .....                              | 80 |
| General Theory .....                                      | 80 |
| Electrostatic Molecular Potentials .....                  | 82 |
| The I/R Expansion .....                                   | 83 |
| Hydrogen-Bonding .....                                    | 86 |
| Practical Approach .....                                  | 88 |

|                                                                            |     |
|----------------------------------------------------------------------------|-----|
| Clusters .....                                                             | 91  |
| Monte Carlo Techniques .....                                               | 92  |
| Water Clusters .....                                                       | 95  |
| Hydrated Ions .....                                                        | 99  |
| Recognition in Aqueous Solution .....                                      | 102 |
| 4. <i>Computational Simulations</i> .....                                  | 105 |
| Energy Expressions and Data Banks .....                                    | 105 |
| Energy Expressions .....                                                   | 106 |
| Atomic and Molecular Data .....                                            | 111 |
| Organization of the Calculations .....                                     | 180 |
| Conformational Analyses .....                                              | 180 |
| Evaluation of Interaction Energies .....                                   | 190 |
| Minimization Techniques .....                                              | 191 |
| General Outline .....                                                      | 191 |
| Steepest-Descent Method .....                                              | 193 |
| Newton-Raphson Method .....                                                | 194 |
| Fletcher-Reeves Method .....                                               | 196 |
| Davidon-Fletcher-Powell Method .....                                       | 198 |
| Stewart Method .....                                                       | 201 |
| Smith-Powell-Zangwill Method .....                                         | 202 |
| Implementation .....                                                       | 205 |
| Practical Applications .....                                               | 206 |
| Conformations .....                                                        | 207 |
| Interactions .....                                                         | 208 |
| Reactions .....                                                            | 215 |
| IV. APPENDICES .....                                                       |     |
| A1. <i>Coordinates</i> .....                                               | 219 |
| A2. <i>Transformation of Coordinates</i> .....                             | 221 |
| A3. <i>Determination of Cartesian Coordinates</i> .....                    | 225 |
| Calculations Using Geometrical Parameters .....                            | 225 |
| Calculations from X-ray Data .....                                         | 232 |
| A4. <i>Spherical Harmonics</i> .....                                       | 233 |
| A5. <i>Basic Statistical-Thermodynamical Formulas</i> .....                | 235 |
| A6. <i>Electric Fields and Moments</i> .....                               | 239 |
| Electric Fields .....                                                      | 239 |
| Electric Moments .....                                                     | 240 |
| Multipole Expansion .....                                                  | 240 |
| A7. <i>Density Distributions: Population Analysis and Properties</i> ..... | 243 |
| Population Analysis .....                                                  | 243 |
| Properties .....                                                           | 244 |
| A8. <i>Bond-Energy Analysis</i> .....                                      | 247 |
| V. REFERENCES .....                                                        | 249 |
| VI. AUTHOR INDEX .....                                                     | 265 |
| VII. SUBJECT INDEX .....                                                   | 269 |
