<i>Preface (in French and English)</i>	xiii
<i>Contents</i>	xxi

— PART I — BASIC BIOLOGY

<i>Course 1. Early ontogeny of the hemopoietic system in vertebrate embryos, by F. Dieterlen-Lièvre</i>	3
0. Introduction	6
1. Extrinsic origin of stem cells and cyclic colonization of the avian thymus	7
2. Mechanisms mediating thymic attractivity for stem cells	10
3. Yolk sac erythropoiesis and hemoglobin switch in the avian embryo	12
4. Origin of intraembryonic stem cells	18
5. In the mouse embryo yolk sac stem cells are able to give rise to primitive and definitive red cells	19
References	22
 <i>Course 2. Genetic determination of distinct stages in the cancerization process, by F. Cuzin</i>	 25
1. Introduction	28
2. The transforming genes of polyoma virus	29
2.1. The <i>hst</i> and <i>tsa</i> mutants	29
2.2. The respective roles of the large T and middle T proteins	29

3. Multigenic transformation in other systems: generalization of the two-step model	30
3.1. Cellular oncogenes	31
3.2. Adenovirus oncogene	31
3.3. The two groups of oncogenes	31
References	32

Course 3. Biosynthesis and sorting of proteins in eucaryotic cells, by G. Kreibich 33

1. Introduction	36
2. Components of the vectorial translocation machinery	39
3. The signal recognition particle (SRP)	39
4. SRP receptor (or docking protein)	40
5. Ribophorins are part of the microsomal translocation apparatus	41
6. The signal peptidase	41
7. Glycosylation	42
8. Biosynthesis of membrane proteins on membrane bound polysomes	42
References	43

PART II - MODELS IN DEVELOPMENTAL BIOLOGY

Course 4. Dictyostelium Discoideum, by G. Gerisch 47

1. Introduction	50
2. Cyclic-AMP signals for chemotaxis and for the control of cell development	52
2.1. Changes of intracellular soluble effectors coupled to the activation of cell-surface receptors	52
2.2. Signal processing to the contractile system of the cells	53
2.3. Periodic regulation of adenylate cyclase and spatio-temporal patterns of excitation waves	54
2.4. Cyclic-AMP pulses as signals in positive feedback control of early development	59
3. Cell adhesion and its role in aggregation and post-aggregative gene expression	61
3.1. The contact site A system of aggregating cells	61
3.2. Attachment of cells to glucoside-derivatized surfaces and its effect on late development	62
4. Concluding remarks	64
References	64

<i>Course 5. Cell type determination and mating type interconversion in yeast, by I. Herskowitz</i>	67
1. Introduction	70
2. The specialized cell types of yeast	70
3. How the mating type locus (<i>MAT</i>) determines cell type: the $\alpha 1$ - $\alpha 2$ hypothesis	72
4. The product of <i>MAT</i> regulate transcription	75
5. Molecular action of <i>MAT</i> products	76
6. A bistable genetic switch involving genetic rearrangement: a cassette mechanism	78
7. Why the silent cassettes are silent	80
8. The mechanism of mating type interconversion	81
8.1. Unidirectional transfer and substitution	81
8.2. Double-strand break	81
8.3. Double-strand break repair	82
8.4. Specificity of transposition	83
9. Regulation of mating type interconversion	83
9.1. Cell type regulation of mating type interconversion	84
9.2. Asymmetry and cell cycle control	84
9.3. Variations on the lineage of <i>HO</i> cells	86
10. Concluding comments	88
10.1. Genetic rearrangement and gene control	88
10.2. Gene regulation in prokaryotes and eukaryotes: concepts and mechanisms	90
Note added in proof	93
References	94
 <i>Course 6. Notes on developmental biology and genetics of the nematode <i>Caenorhabditis elegans</i>, by J. Hodgkin</i>	 99
1. Lifecycle	102
2. Advantages of <i>C. elegans</i> for the study of development	102
2.1. Ease of culture	104
2.2. Small size and transparency	104
2.3. Invariance	104
2.4. Simplicity	105
2.5. Genetics	105
3. Description of normal development	106
3.1. Outline of development	107
3.2. Invariance of cell lineages	108
3.3. Autonomy and regulation	109
3.4. Germ layers	110
3.5. Symmetry	110

3.6. Cell migration	111
3.7. Cell death	111
4. Regulative interactions	112
4.1. Short range interactions; equivalence groups	112
4.2. Long range interactions; control of germ cell division	114
5. Genetic analysis	114
5.1. Switch genes	115
5.2. Sex determining genes	116
5.3. Epistatic interactions	117
5.4. Other switch genes	118
References	118

Course 7. Outlines of early mouse embryogenesis, by H. Condamine 121

0. Introduction	124
1. Major features of mouse early development	125
2. Cell lineages in the early mouse embryo	129
3. Cell commitment in the late morula and early blastocyst	132
4. Teratocarcinoma and normal mouse development	136
5. Endoderm differentiation in the early post-implantation embryo	140
6. Aspects of genomic expression during early mouse embryogenesis	144
7. Mutants of early mouse embryogenesis	148
7.1. t chromosomes	152
7.2. Insertion mutagenesis	154
References	155

Course 8. Biochemical and pharmacological properties of membrane cation transporting systems involved in membrane excitability, by C. Frelin 159

1. Introduction	162
2. The Na ⁺ channel	162
2.1. Tetrodotoxin (TTX) and saxitoxin (STX)	162
2.2. Lipid soluble toxins	163
2.3. Polypeptide toxins from North American and north African scorpions and from sea anemones	163
2.4. Polypeptide toxins from Central and South American scorpions	164
2.5. Pyrethrinoids	164
2.6. Ciguatoxin	165
2.7. Electrically silent forms of Na ⁺ channels	166

3. The Ca^{2+} dependent K^{+} channel	166
4. Ca^{2+} channels	166
References	167

Course 9. Hormonal regulation of transcriptional enhancement, by K.R. Yamamoto 171

1. Introduction	174
2. Receptor binding regions are glucocorticoid response elements	175
3. GRE activation alters chromatin structure	179
4. Enhancers may facilitate regulatory evolution	181
5. Hormones regulate networks of genes	182
6. Multiple enhancers allow diverse expression patterns	184
7. Perspectives and speculation	187
References	189

PART III – HIGHLY SPECIALIZED SYSTEMS

Course 10. The vertebrate hemopoietic system, by N.N. Iscove 195

1. The hemopoietic system	198
2. Stem cells	198
3. Clonal analysis	199
4. Spleen colony-forming cells	200
5. Hemopoietic stem cells demonstrated with clonal methods	200
6. Some unresolved issues concerning early cells	201
6.1. Immortality versus clonal succession	201
6.2. Function in the normal steady state	201
6.3. Instruction versus selection	201
6.4. Molecular mechanisms	202
7. Early cells <i>in vitro</i>	202
8. Hemopoietic growth factors	202
9. Current and prospective experimental opportunities	203
9.1. The known hemopoietic factors	203
9.2. Unknown hemopoietic factors	203
9.3. The repopulating stem cells	204

9.4. Early lymphoid precursors	204
9.5. Engineered synchrony by introduction of transforming genes	204
References	204

Course 11. Differentiation of cation transporting systems during skeletal and cardiac myogenesis, by C. Frelin and J.-F. Renaud 207

1. Differentiation of skeletal muscle cells	210
1.1. The Na ⁺ channel in chick muscle cells	210
1.2. The Na ⁺ channel in rat muscle cells	211
1.3. The (Na ⁺ , K ⁺)ATPase in chick muscle cells	212
1.4. The Ca ²⁺ -dependent K ⁺ channel in rat muscle cells	213
1.5. The Ca ²⁺ channel in chick muscle cells	213
1.6. The relationship between morphological differentiation and the appearance of Na ⁺ and Ca ²⁺ channels and of the (Na ⁺ , K ⁺)ATPase in chick muscle cells	213
1.7. Influence of denervation on membrane structures involved in excitability	214
1.8. Coordinately regulated gene sets in muscle development	214
2. Differentiation of cardiac muscle cells	215
2.1. Ionic permeabilities during cardiac development	216
2.2. The Na ⁺ channel in chick cardiac cells	216
2.3. The Na ⁺ channel in rat cardiac cells	216
2.4. The (Na ⁺ , K ⁺)ATPase in chick cardiac cells	217
2.5. The Ca ²⁺ channel in chick cardiac cells	217
2.6. The transition from a non-functional to a functional state of ion channels during chick cardiac ontogenesis	217
3. Conclusions	218
References	218

Course 12. Early neurogenesis in vertebrates, by J.-P. Thiery and J.-C. Boucaut 221

1. Formation of the neural primordium	224
1.1. Polarity in amphibian eggs	224
1.2. Fate maps	224
1.3. The primary induction	226
1.4. Mechanics of gastrulation	228
1.5. Fibronectin in gastrulation	228
1.6. Morphogenesis of the neural plate	229
1.7. Early differentiation in the nervous system	231
2. The neural crest	231
2.1. Definition and potentialities	231
2.2. Migration pathways	232
2.3. Role of fibronectin in cell adhesion and migration	236

2.4. Gangliogenesis	239
2.5. A model for the patterning of the peripheral nervous system in birds	239
3. Concluding remarks	240
References	241

Course 13. Cell-cell interactions in vertebrate central nervous system development, by C. Goridis 245

1. Basic features of central nervous system development	248
1.1. Proliferation	248
1.2. Migration	249
1.3. Differentiation	250
1.4. Cell death and elimination of synapses	250
2. Mechanisms of axonal pathfinding	251
2.1. The growth cone	251
2.2. Axon guidance by intrinsic factors	253
2.3. The blueprint hypothesis	254
2.4. Pioneer fibers	254
2.5. Chemotaxis	254
2.6. Surface labels	255
3. Cell-cell recognition, adhesion and cell adhesion molecules	256
3.1. Basic features of cell recognition and adhesion	256
3.2. Selective cell adhesion in the retino-tectal system	257
3.3. The search for positional markers	258
3.4. N-CAM, the first identified adhesion molecule of the nervous system	258
3.5. Other cell adhesion molecules	260
4. Cell interactions in the development of central dopaminergic neurones	261
4.1. Influence of target neurones on neuronal maturation	261
4.2. Influence of target glial cells on neurite shape	262
References	262

Course 14. Basic elements in immunology, by M. Fougereau 265

1. General phenomenology	268
1.1. Humoral responses	268
1.2. Cell-mediated responses	270
1.3. Immunological tolerance	272
1.4. Humoral and cellular immunity: unicity or duality of the recognition system?	272
2. Antigens	274
2.1. Definitions	274
2.2. Primary and secondary responses	274
2.3. Natural antigens	275
2.4. Models for the study of antigenicity	275

3. Antibodies and immunoglobulins	276
3.1. General considerations	276
3.2. Models for studying the antibody structure	276
3.3. Multichain structure of immunoglobulins	277
3.4. Classes of immunoglobulins	278
3.5. The antibody combining site and the diversity problem	278
3.6. Organization of Ig genes and the origin of antibody diversity	281
4. B and T lymphocytes: duality of the recognition system	284
4.1. Two distinct populations of lymphocytes are implicated in immune responses	284
4.2. General notions on the origin and differentiation of T and B lymphocytes	285
4.3. Cellular interactions in antibody synthesis (B-T cooperation)	285
4.4. The carrier effect and the B-T cooperation	286
4.5. Cellular interactions in "cell-mediated" immune response (T-T cooperation)	287
4.6. B and T lymphocytes recognize epitopes in a different way	287
5. Conclusions: the immune system uses 3 main gene complexes	288

Course 15. T-cell antigen receptors and the immunoglobulin supergene family, by L. Hood, M. Kronenberg and T. Hunkapiller 291

1. Introduction	294
2. The organization and rearrangement of immunoglobulin and T-cell receptor genes	294
3. Diversification of T-cell receptor genes	296
4. T-cell antigen receptors and T-cell function	297
5. Accessory molecules involved in T-cell antigen recognition and function	298
6. Immunoglobulin supergene family	299
7. Evolution of the genes of the immunoglobulin supergene family	300
8. Evolutionary strategies in the supergene family	303
References	304

Course 16. From the simplicity of clonal selection to complexities of immune networks, by J. Urbain 307
