|----------------------------------------------------------|------|-----|
| <i>List of figures</i>                                   | page | x   |
| <i>Preface</i>                                           |      | xv  |
| <b>1 Understanding natural selection</b>                 |      | 1   |
| 1.1 Natural selection                                    |      | 2   |
| 1.2 Genetical approaches to natural selection            |      | 7   |
| 1.3 Natural selection as an evolutionary game            |      | 10  |
| 1.4 Road map                                             |      | 21  |
| <b>2 Underlying mathematics and philosophy</b>           |      | 26  |
| 2.1 Scalars, vectors, and matrices                       |      | 28  |
| 2.2 Dynamical systems                                    |      | 33  |
| 2.3 Biological population models                         |      | 39  |
| 2.4 Examples of population models                        |      | 42  |
| 2.5 Classical stability concepts                         |      | 49  |
| <b>3 The Darwinian game</b>                              |      | 61  |
| 3.1 Classical games                                      |      | 62  |
| 3.2 Evolutionary games                                   |      | 72  |
| 3.3 Evolution by natural selection                       |      | 83  |
| <b>4 <math>G</math>-functions for the Darwinian game</b> |      | 88  |
| 4.1 How to create a $G$ -function                        |      | 89  |
| 4.2 Types of $G$ -functions                              |      | 91  |
| 4.3 $G$ -functions with scalar strategies                |      | 92  |
| 4.4 $G$ -functions with vector strategies                |      | 93  |
| 4.5 $G$ -functions with resources                        |      | 96  |
| 4.6 Multiple $G$ -functions                              |      | 99  |
| 4.7 $G$ -functions in terms of population frequency      |      | 103 |

|          |                                                                       |     |
|----------|-----------------------------------------------------------------------|-----|
| 4.8      | Multistage $G$ -functions                                             | 106 |
| 4.9      | Non-equilibrium dynamics                                              | 110 |
| <b>5</b> | <b>Darwinian dynamics</b>                                             | 112 |
| 5.1      | Strategy dynamics and the adaptive landscape                          | 113 |
| 5.2      | The source of new strategies: heritable variation and mutation        | 116 |
| 5.3      | Ecological time and evolutionary time                                 | 119 |
| 5.4      | $G$ -functions with scalar strategies                                 | 120 |
| 5.5      | $G$ -functions with vector strategies                                 | 131 |
| 5.6      | $G$ -functions with resources                                         | 140 |
| 5.7      | Multiple $G$ -functions                                               | 141 |
| 5.8      | $G$ -functions in terms of population frequency                       | 143 |
| 5.9      | Multistage $G$ -functions                                             | 144 |
| 5.10     | Non-equilibrium Darwinian dynamics                                    | 145 |
| 5.11     | Stability conditions for Darwinian dynamics                           | 147 |
| 5.12     | Variance dynamics                                                     | 149 |
| <b>6</b> | <b>Evolutionarily stable strategies</b>                               | 151 |
| 6.1      | Evolution of evolutionary stability                                   | 153 |
| 6.2      | $G$ -functions with scalar strategies                                 | 160 |
| 6.3      | $G$ -functions with vector strategies                                 | 168 |
| 6.4      | $G$ -functions with resources                                         | 170 |
| 6.5      | Multiple $G$ -functions                                               | 174 |
| 6.6      | $G$ -functions in terms of population frequency                       | 180 |
| 6.7      | Multistage $G$ -functions                                             | 183 |
| 6.8      | Non-equilibrium Darwinian dynamics                                    | 188 |
| <b>7</b> | <b>The ESS maximum principle</b>                                      | 197 |
| 7.1      | Maximum principle for $G$ -functions with scalar strategies           | 198 |
| 7.2      | Maximum principle for $G$ -functions with vector strategies           | 205 |
| 7.3      | Maximum principle for $G$ -functions with resources                   | 211 |
| 7.4      | Maximum principle for multiple $G$ -functions                         | 213 |
| 7.5      | Maximum principle for $G$ -functions in terms of population frequency | 219 |
| 7.6      | Maximum principle for multistage $G$ -functions                       | 222 |
| 7.7      | Maximum principle for non-equilibrium dynamics                        | 225 |
| <b>8</b> | <b>Speciation and extinction</b>                                      | 231 |
| 8.1      | Species concepts                                                      | 234 |
| 8.2      | Strategy species concept                                              | 236 |
| 8.3      | Variance dynamics                                                     | 243 |
| 8.4      | Mechanisms of speciation                                              | 251 |

|           |                                                                    |     |
|-----------|--------------------------------------------------------------------|-----|
| 8.5       | Predator-prey coevolution and community evolution                  | 264 |
| 8.6       | Wright's shifting balance theory and frequency-dependent selection | 266 |
| 8.7       | Microevolution and macroevolution                                  | 268 |
| 8.8       | Incumbent replacement                                              | 272 |
| 8.9       | Procession of life                                                 | 273 |
| <b>9</b>  | <b>Matrix games</b>                                                | 275 |
| 9.1       | A maximum principle for the matrix game                            | 277 |
| 9.2       | The $2 \times 2$ bi-linear game                                    | 284 |
| 9.3       | Non-linear matrix games                                            | 295 |
| <b>10</b> | <b>Evolutionary ecology</b>                                        | 304 |
| 10.1      | Habitat selection                                                  | 304 |
| 10.2      | Consumer-resource games                                            | 309 |
| 10.3      | Plant ecology                                                      | 324 |
| 10.4      | Foraging games                                                     | 333 |
| <b>11</b> | <b>Managing evolving systems</b>                                   | 343 |
| 11.1      | Evolutionary response to harvesting                                | 344 |
| 11.2      | Resource management and conservation                               | 350 |
| 11.3      | Chemotherapy-driven evolution                                      | 359 |
