

Table of Contents

<i>Preface</i>	xi
CHAPTER 1	
Normal Cell Division	1
Sea urchin egg cleavage	4
Unilateral cleavage, ctenophores, and amphibia	10
Tissue cell division	15
CHAPTER 2	
Theories of Cell Division	21
Theories that postulate a physically active mitotic apparatus	24
Traction fiber theories	24
Expanding spindle theories	28
Astral cleavage theories	29
Theories that postulate a physically active surface	31
Equatorial contraction theories	31
Equatorial tension increase	32
Polar tension decrease	36
Equatorial tension decrease or polar tension increase	40
Local surface growth and expansion theories	42
No force implied: diastema and vesicles	42
Force implied: active expansion	45
Hybrid theories	46
Hypothetical stimulus mechanisms	50
Global stimulation combined with mitotic apparatus interference	51

Regionally restricted stimulation mechanisms	51
Polar stimulation	52
Equatorial stimulation	53

CHAPTER 3

The Site of the Division Mechanism 56

The mitotic apparatus	57
The region between the spindle and the surface	62
The surface	64

CHAPTER 4

The Nature of the Division Mechanism 69

Expanding surface mechanisms	70
Equatorial constriction mechanism	80
Polar tension decrease	81
Equatorial tension increase	83
Force measurements	85

CHAPTER 5

Positioning the Division Mechanism 90

How is the position of the mitotic apparatus determined?	91
Orientation during formation	91
Reorientation of the formed mitotic apparatus	93
Which parts of the mitotic apparatus are necessary?	95
Chromosomes	95
Spindle	104
Asters	105
The diastema	107
How is division mechanism formation temporally related to mitosis?	108
When is the position of the furrow established?	109
What is the duration of the stimulus period?	112
What geometrical relations between the surface and the mitotic apparatus are necessary?	120
Cleavage cells	121
How does distance affect the mitotic apparatus-surface interaction?	121
Is the normal opportunity for interaction between the surface and all parts of the mitotic apparatus essential?	127
Is the normal distance between the asters important?	131
Tissue cells	135

CHAPTER 6

Formation of the Division Mechanism

139

- Prefurrow phenomena 140
 - Stiffness changes 140
 - Changes in cortical gel strength 143
 - Resistance to bursting 144
 - Mitotic apparatus-induced surface contractility 146
 - Cortical birefringence 148
 - Prefurrow cortical response to chemical and physical agents 149
 - Prefurrow behavior changes in the normal equatorial surface 150
 - Prefurrow distribution of contraction-related molecules 151
- The beginning of cleavage 156
 - Sources of contractile ring material 159
 - Factors involved in assembly of the contractile ring 165
 - Cortical movement 165
 - Subcortical movement 167
 - Ultrastructural changes at the beginning of cleavage 168
 - Contractile ring changes during cytokinesis 169
 - Composition of the contractile ring 170
 - Actin 170
 - Myosin 174
 - Attachment proteins 177
 - Organization and force production 178
 - Energy requirements 184

CHAPTER 7

The Stimulus-Response System

186

- Modes of furrow establishment 187
- The rate of stimulus movement 190
- How long does the stimulus-response system remain active? 191
- How is the nonuniform distribution of the cleavage stimulus accomplished? 193
- Degree of structural normality required for effective operation 204
 - The surface 204
 - The subsurface 209
- Aster-induced relaxation or aster-induced contraction? 213

Mitotic apparatus activity	218
The cleavage stimulus or signal	219
Chemistry of potential stimuli and signals	223
Signal transport	227
 CHAPTER 8	
Division Mechanism Function and Its Consequences	230
Duration of the functional period	230
Division activity and surface increase	234
Documentation of normal surface changes	235
Small eggs	235
Large eggs	245
Tissue cells	253
Bulk cytoplasmic movement	257
Disappearance of the contractile ring	260
Effects of component interaction	260
Effects of cell surface deformation	262
 CHAPTER 9	
Informative Variations on the Normal Process	265
Unequal division	265
Micromere formation	269
Unequal cleavage	272
Ganglion cell formation	274
Polar body formation	280
Polar lobe formation	298
Delayed cytokinesis	307
Division of <i>Amoebae</i>	321
 CHAPTER 10	
Conclusion	329
 <i>References</i>	341
<i>Author Index</i>	375
<i>Subject Index</i>	381
