1 Introduction to kinetic analysis of enzyme systems 1

Kenneth A. Johnson

1	Steady-state kinetic analysis: what you learn	2
2	Enzyme inhibition patterns	4
2.1	Active site titration	4
3	Data fitting by nonlinear regression	5
3.1	Transient kinetic methods	6
4	Substrate binding kinetics	7
5	Measuring the dissociation rate by competition	9
6	Kinetics of a pre-steady-state burst	10
7	Kinetics of a single turnover	12
8	Kinetics of a lag: what is a lag time?	13
9	Site-directed mutagenesis and proper analysis of mutants	15
10	Global fitting of kinetic and equilibrium data by computer simulation	15
11	Summary	17
	References	17

2 Detection and characterization of enzyme intermediates: utility of rapid chemical quench methodology and single enzyme turnover experiments 19

Karen S. Anderson

1	Introduction	19
2	Criteria for establishing enzyme intermediates	20
3	Rapid chemical quench methodology	21
4	Single turnover experiments for the detection of enzyme intermediates	23

5	Selected examples of enzyme studies using a rapid chemical quench strategy to detect and characterize enzyme intermediates	24
5.1	Introduction	24
5.2	PEP-utilizing enzymes that catalyze C—O bond cleavage of phosphoenolpyruvate	24
5.3	A covalent phosphoryl cysteine enzyme intermediate in a tyrosine phosphatase	33
5.4	Tryptophan synthase: probing substrate channelling in a bifunctional enzyme and searching for indole as an intermediate	36
6	New directions and approaches for detecting and characterizing enzyme intermediates	41
6.1	Mass spectrometry: a novel approach to the detection of enzyme intermediates	41
6.2	Recent advances in mass spectroscopy to study biomolecules	42
6.3	Conclusions	44
	References	44

Kinetic analysis of ribozyme cleavage 49

Philip C. Bevilacqua, Trevor S. Brown, Durga M. Chadalavada, Amy Diegelman-Parente, and Rieko Yajima

1	Introduction and scope	49
2	Initial considerations for the system and experiments	50
2.1	Choosing and preparing the system	50
2.2	Choosing the experiment	54
2.3	Deriving kinetic equations	55
2.4	Simulating data	59
3	Kinetic analysis of ribozymes using radiolabelled RNA	62
3.1	Introduction: advantages and disadvantages of radiolabelled methods	62
3.2	Preparing ribozymes and RNA substrates	62
3.3	A few guidelines for purifying and handling RNA	67
3.4	Radiolabelling ribozymes	68
3.5	Slow (hand-mixing) kinetics	69
3.6	Fast (quench-flow mixing) kinetics	72
4	Kinetic analysis of ribozymes: overview of optical techniques	72
	Acknowledgements	73
	References	73

Kinetics analysis of DNA–protein interactions by time–resolved synchrotron X-ray footprinting 75

Gauri M. Dhavan, Mark R. Chance, and Michael Brenowitz

1	Preparation of materials and choice of experimental conditions	76
2	Determining the X-ray exposure required for optimal DNA cutting	76
3	Conducting a quench flow hydroxyl radical experiment	79
4	Data analysis	83
5	Summary and conclusion	84
	Acknowledgements	84
	References	85

5 Transient-state kinetics and computational analysis of transcription initiation 87

Smita S. Patel, Rajiv P. Bandwar, and Mikhail K. Levin

- 1 Introduction 87
 - 1.1 RNA polymerase 88
 - 1.2 Minimal pathway 88
- 2 Experimental approach 89
 - 2.1 Fluorimetric methods 89
 - 2.2 DNA 91
 - 2.3 Protein 93
- 3 Equilibrium fluorescence measurement 95
 - 3.1 Fluorescence of T7 RNAP-DNA complex 95
 - 3.2 Equilibrium dissociation constant 96
- 4 Kinetics of RNAP and promoter DNA binding 99
 - 4.1 Stopped flow kinetics of p-dsDNA binding 99
 - 4.2 Dissociation rate constant 101
 - 4.3 Stopped flow kinetics of dsDNA promoter binding 103
 - 4.4 DNA binding in the presence of initiating GTP 105
- 5 Kinetics of initiating GTP binding 107
- 6 Radiometric assay for RNA synthesis 108
- 7 Data simulation and fitting 112
 - 7.1 Model building and simulation 113
 - 7.2 Data fitting 119
- Acknowledgements 127
- References 128

6 A fluorescent sensor to assay inorganic phosphate 131

Martin R. Webb

- 1 Introduction 131
- 2 P_i sensor 131
 - 2.1 Background 131
 - 2.2 Preparation and characterization 133
- 3 An enzymic assay for P_i 137
- 4 P_i mop 139
- 5 Choice of assay method 140
 - 5.1 Summary of different types of phosphate assay 140
 - 5.2 Fluorescence versus absorbance 140
- 6 Practical considerations 142
 - 6.1 General considerations 142
 - 6.2 Minimizing contaminant P_i 142
 - 6.3 Other considerations for using the P_i sensor 143
 - 6.4 Limitations of the P_i sensor 146
- 7 Measurement of P_i formation kinetics using the P_i sensor 147
- Acknowledgements 151
- References 151

What to do if there is no signal: using competition experiments to determine binding parameters 153

Nicolas Thomä and Roger S. Goody

- 1 Introduction 153
- 2 Determination of equilibrium constants of unlabelled ligands 153
- 3 Use of transient experiments to determine rate constants of unlabelled molecules 159
 - 3.1 Competitive displacement 159
 - 3.2 Competitive association kinetics 161
- 4 Conclusion 169
- References 169

The biotin regulatory system—kinetic, thermodynamic, and structural interrogation of a biological switch 171

Dorothy Beckett

- 1 Overview 171
- 2 The participants in the biotin regulatory system 173
- 3 Protein-small ligand binding studies 175
 - 3.1 Kinetic methods for measurement of binding of the biotin and bio-5'-AMP to BirA 176
 - 3.2 Kinetic stability of BirA · small ligand complexes 176
- 4 An enzymatic assay to measure dissociation of the BirA · bio-5'-AMP complex 178
- 5 Kinetic measurements of bimolecular association of BirA with small ligands: evidence of ligand-induced conformational changes 181
- 6 Low resolution structural analysis of the system 183
- 7 Functional studies of flexible loops in BirA 185
 - 7.1 The glycine-rich loop and small ligand binding 185
 - 7.2 A flexible loop in biotin and bio-5'-AMP binding 186
 - 7.3 Flexible loops in DNA binding and dimerization 187
- 8 Bio-5'-AMP binding promotes dimerization of BirA 189
- 9 Involvement of flexible loops in site-specific DNA binding and dimerization 191
- 10 X-ray crystallographic determination of the dimer structure 191
- 11 The structural basis of the biological switch 193
- 12 Kinetics of DNA binding and the functional switch in BirA 194
- 13 Measurement of association of holoBirA with bioO 197
- 14 Data analysis 200
- 15 Summary 200
- References 200

Time resolved spectral analysis 203

Bruce A. Palfey

- 1 Introduction 203
- 2 Experimental design 204

- 2.1 Sample concentration and quality 204
- 2.2 Reaction conditions 204
- 2.3 Types of kinetic experiments for spectral analysis 208
- 2.4 Anaerobic experiments 209
- 3 Methods for collecting spectral data 218
 - 3.1 Single-wavelength traces 218
 - 3.2 Rapid scanning 219
- 4 Calculating spectra 220
 - 4.1 Global analysis 221
 - 4.2 Singular value decomposition 223
 - 4.3 Additional considerations 224
- References 227

10 Kinetic analysis of enzyme mutants for identification of catalytic residues 229

Yansheng Wei, Lusong Luo, Wenhai Zhang, and Debra Dunaway-Mariano

- 1 Introduction 229
 - 1.1 Statement of purpose 229
 - 1.2 Defining the catalytic site of the enzyme 229
 - 1.3 Defining the reaction steps catalysed by the enzyme 230
 - 1.4 Targeting potential catalytic residues 232
 - 1.5 Screening mutants for transient kinetic analysis 233
- 2 Kinetic analysis 234
 - 2.1 Defining the kinetic mechanism: an overview 234
 - 2.2 Defining rate constants for substrate and product binding and release steps 235
 - 2.3 Determining time courses for single turnover reactions 241
 - 2.4 Extracting microscopic rate constants from single turnover kinetic data 244
 - 2.5 Comparison of turnover rates derived from microscopic rate constants to experimental steady-state turnover rates 245
- 3 Interpretation of results 248
 - 3.1 Structure determinations of mutants 248
 - 3.2 Additional mutants to be analyzed 249
- References 249
