Preface to the Third Edition, xi

Preface to the First Edition, xiii

INTRODUCTION I

CHAPTER ONE

THE MASTER ELEMENTS OF CONTROL II

Components of the Switch 14

DNA 14

RNA Polymerase 15

The Repressor 16

Cro 17

The Action of Repressor and Cro 18

Negative Control 18

Positive Control 18

Cooperativity of Repressor Binding 20

Induction—Flipping the Switch 22

Cooperativity—Switch Stability and Sensitivity 26

The Effect of Autoregulation 28

Other Cases 28

CHAPTER TWO

PROTEIN-DNA INTERACTIONS AND GENE CONTROL 31

The Operator 31

Repressor 34

Cro 37

Amino Acid-Base Pair Interactions 39

The Promoter 43

Gene Control 44

CHAPTER THREE

CONTROL CIRCUITS—SETTING THE SWITCH 47

A Brief Overview of λ Growth 48

The Genetic Map 48

Circularization 49

Gene Expression 50

Integration 51

Control of Transcription 52

Very Early 52

Early 52

Late Lytic 53

Late Lysogenic 55

The Decision 56

Control of Integration and Excision 57

Case 1—Establishing Lysogeny 58

Case 2—Lytic Growth 58

Case 3—Induction 58

Other Phages 60

The SOS Response 60

λ Pathways and Cell Development 62

Regulatory Genes 62

Switches 63

Patterns of Gene Expression 64

CHAPTER FOUR

HOW DO WE KNOW—THE KEY EXPERIMENTS 67

The Repressor Idea 67

Clear and Virulent Mutants 67

Observations 67

Explanation 68

Immunity and Heteroimmunity 69

Observations 69

Explanation 70

Asymmetry in Bacterial Mating 70

Observations 70

Explanation 71

The Repressor Problem in the Early 1960s 71

Repressor Isolation and DNA Binding 72

Making More Repressor 74

The Claims of Chapters One and Two 76

The repressor is composed of two globular domains held together by a linker of some 40 amino acids 76

The repressor dimerizes, largely through interaction between its carboxyl domains 76

A repressor dimer binds, through its amino domains, to a 17 base pair operator site 78

A single operator site binds one dimer of repressor 78

Dimers form before DNA binding 80

The amino domains contact DNA 82

There are three 17 base pair repressor binding sites in the right operator. At each site repressor and Cro bind along the same face of the helix 84

Chemical probes 84

Operator mutations 85

Binding to supercoiled and linear DNA 85.

Repressor binds to three sites in O_R with alternate pairwise cooperativity. The cooperativity is mediated by interactions between carboxyl domains of adjacent dimers 86

In a lysogen repressor is typically bound to O_{R1} and O_{R2} . The bound repressors turn off rightward transcription of *cro* and stimulate leftward transcription of *cl*. At higher concentrations, repressor binds to O_{R3} to turn off transcription of *cl* 87

Cro binds first to O_{R3} , then to O_{R1} and O_{R2} , thereby first turning off $P_{RM'}$ then P_R 92

Some background about Cro 92

Cro in vivo 93

Cro in vitro 94

RecA cleaves repressor to trigger induction 94

When Cro is bound at O_{R3} the switch is thrown 95

Repressor and Cro bind to the operator as shown in Figures 2.6, 2.8, 2.10, and 2.11 95

Crystallography 95

The "helix swap" experiment 96

<i>Specific amino acid-base pair contacts</i>	98
<i>The role of the arm of λ repressor</i>	99
Repressor activates transcription of <i>cl</i> by binding to O_R2 and contacting polymerase with its amino domain	99
<i>Positive control mutants</i>	99
<i>Positive control in vitro</i>	102
Conclusion	103

CHAPTER FIVE

2004: NEW DEVELOPMENTS 109

1. Long-range Cooperativity and Repression of P_{RM} 109
 - An Octamer of Repressor Binds O_R and O_L 110
 - Autonegative Regulation of Repressor Synthesis 112
 - How Do We Know* 113
 - Long-range Interactions and Repression of P_R 113
 - Long-range Interactions and Repression of P_{RM} 114
 - Activation and Repression of P_{RM} 114
 - Repressor Structure 115
2. Positive Control (Activation of Transcription) 122
 - Polymerase and Promoter 122
 - The Mechanism of Activation 123
 - How Do We Know* 123
 - Activating Region Variants 123
 - A Suppressor of a *pc* Mutant 125
 - Crystallography 125
 - Activator Bypass 125
 - Changing Activating Regions and Target Context 127
3. The Structure of the Repressor Monomer and the Mechanism of Repressor Cleavage 131
 - How Do We Know* 132
4. Evolving the Switch 133
 - Changing the Affinities of Sites in O_R for Repressor 133
 - Eliminating Positive Control 134
 - Eliminating Cooperativity between DNA-binding Dimers 134
5. CII and the Decision 136
