1 How to Study Vision 1

Encoding 1

Representation 2

Interpretation 3

The Range of Material in This Book 3

Theory 3

Data 4

Applications 5

A Guide to the Principles of Vision 6

The Inescapable Components of Image Encoding 6

Adaptation and Flexibility 7

Image Representation: Visual Streams 7

Image Interpretation: Statistical Inferences 7

Part One Encoding

2 Image Formation 13

Studying Reflections from the Eye 13

Linear-Systems Methods 17

Homogeneity 20

Superposition 21

Implications of Homogeneity and Superposition 22

Why Linear Methods Are Useful 24

Shift-Invariant Linear Transformations 25

Shift-Invariant Systems: Definition 25

Shift-Invariant Systems: Properties 25

The Optical Quality of the Eye	27
<i>The Linespread Function</i>	29
<i>The Modulation Transfer Function</i>	30
Lenses, Diffraction, and Aberrations	32
Lenses and Accommodation	32
Pinhole Optics and Diffraction	35
<i>The Pointspread Function and Astigmatism</i>	38
Chromatic Aberration	40
Exercises	42

3 **The Photoreceptor Mosaic** 45

The Photoreceptor Types	46
Units of Visual Angle	48
The S-Cone Mosaic	50
Behavioral Measurements	50
Biological Measurements	51
Why Are the S-Cones Widely Spaced?	53
Visual Interferometry	54
Sampling and Aliasing	57
<i>Sampling Is a Linear Operation</i>	59
Aliasing of Harmonic Functions	59
Experimental Implications	60
The L- and M-Cone Mosaics	60
Visual Interferometry: Measurements of Human Optics	63
Summary and Discussion	63
Exercises	65

4 **Wavelength Encoding** 69

Measuring the Spectral Composition of Light	70
Scotopic Wavelength Encoding	73
<i>Matching: Homogeneity and Superposition</i>	74
Uniqueness	76
<i>The Biological Basis of Scotopic Matching</i>	77
Photopic Wavelength Encoding	80
Measurements of the Color-Matching Functions	83
Uniqueness of the Color-Matching Functions	85
A Standard Set of Color-Matching Functions	87
The Biological Basis of Photopic Color-Matching	88
Measuring Cone Photocurrents	89
Static Nonlinearities: Photocurrents and Photopigments	91
Static Nonlinearities: The Principle	94
Cone Photopigments and Color-Matching	94
Why This Is a Big Deal	95
Color Deficiencies	97
Small-Field Dichromacy	97
Dichromatic Observers	97
Anomalous Observers	100
Color Appearance	100
Exercises	101

Part Two Representation

5 The Retinal Representation 111

An Overview of the Retina 112

Retinal Structure 112

Retinal Function:
Specialization 114

Retinal Function:
Image Contrast and
Adaptation 117

Visual Streams 117

Methods of Classifying
Neurons 118

Morphology of Parasol
and Midget Ganglion
Cells 118

Variation with Retinal
Eccentricity 120

Central Projections 122

Conduction Time and Contrast
Gain 124

Visual Information Encoded
by the Parvocellular
and Magnocellular
Pathways 126

Retinal Ganglion Cell Response to Light 128

Center-Surround
Organization 129

Measurements of Receptive
Fields 130

Steady-State
Measurements 131

The Two-Dimensional
Receptive Field 134

Contrast-Sensitivity
Functions 135

Why Contrast Patterns Are
Important 137

Connections to Different Cone
Types 138

Spatio-temporal Analysis: Lines
and Spots 139

Spatio-temporal
Measurements: Harmonic
Functions 140

Space-Time Separability 143

The Difference of Gaussian
Model 144

Retinal Light Adaptation 145

Contrast Sensitivity:
Dependence on Mean
Intensity 146

Comparison with Behavioral
Contrast Sensitivity 148

Exercises 150

6 The Cortical Representation 153

Overview of the Visual Cortex 153

The Architecture of the Primary Visual Cortex 155

The Layers of Area V1 155

The Pathway to Area V1 157

Electrical Stimulation of
Human Area V1 163

Receptive Fields in the Primary Visual Cortex 165

Orientation Selectivity 167

Direction Selectivity 170

Contrast Sensitivity of Cortical
Cells 172

Contrast Normalization 174
Binocular Receptive
Fields 176

Visual Streams in the Cortex 182

The Fate of the Parvocellular
and Magnocellular
Pathways 182

Cytochrome Oxidase
Staining 183

Areas Central to Primary
Cortex 185

Cortical Representations and
Perception 187

The Function of the Visual
Areas 188

Exercises 192

7 Pattern Sensitivity 195

A Single-Resolution
Theory 196

The Neural Image 197

Schade's Single-Resolution
Theory 199

Spatial Contrast-Sensitivity
Functions 201

The Psychophysical Linespread
Function 202

Discussion of the Theory:
Static Nonlinearities 206

Experimental Tests 206

Intermediate Summary 211

Multiresolution Theory 212

Pattern Adaptation 212

Pattern Discrimination and
Masking 216

Masking and Facilitation 219

The Conceptual Advantage
of Multiresolution
Theories 221

Challenges to Multiresolution
Theory 223

Pattern Adaptation to
Mixtures 223

Masking with Mixtures 226

Multiresolution Theory:
Current Status 227

Pattern Sensitivity and Other
Viewing Parameters 228

Light Adaptation 229

Spatiotemporal Contrast
Sensitivity 231

Temporal Sensitivity and Mean
Luminance 233

Pattern-Color Sensitivity 234

Retinal Eccentricity 236

Linking Hypotheses 238

Spatial Localization 239

Summary 243

Exercises 244

8 Multiresolution Image Representations 247

Efficient Image
Representations 248

Intensity Redundancy in Image
Data 250

Spatial Redundancy in Image
Data 251

Decorrelating
Transformations 254

Lossy Compression 255

Perceptually Decorrelated
Features 256

A Block Transformation: The
JPEG-DCT 258

Image Pyramids 262

The Pyramid Operations:
General Theory 263

Pyramids: An Example 265

Image Compression Using the
Error Pyramid 267

QMF's and Orthogonal
Wavelets 270

Applications of Multiresolution
Representations 273

Image Blending 273

Progressive Image
Transmission 276

Threshold and
Recognition 278

Exercises 280

Part Three Interpretation

9 Color 287

Color Constancy: Theory 288

Spectral Image

Formation 290

Surface-Reflectance

Estimation 295

Linear Models 296

Simple Illuminant

Estimation 300

Surface Reflectance

Models 301

Sensor-Based Error

Measures 303

Surface and Illuminant

Estimation Algorithms 305

Illuminant Correction: An

Example Calculation 306

Color Constancy:

Experiments 309

Asymmetric Color-Matching

Experiments 309

The Linearity of Asymmetric

Color Matches 311

The von Kries Coefficient Law:

Experiments 313

How Color-Constant Are

We? 314

The Perceptual Organization of Color 315

Opponent Colors 318

Hue Cancellation 319

Opponent-Colors

Measurements at

Threshold 320

Opponent Signals in the Visual

Pathways 322

Decorrelation of the Cone

Absorptions 324

Spatial Pattern and

Color 326

The Cortical Basis of Color Appearance 329

Clinical Studies 329

Congenital

Monochromacy 330

Regularities of the Cerebral

Dyschromatopsia

Syndrome 330

Behavioral Studies of

Patients with Cerebral

Dyschromatopsia 331

How Many Cone Types Are

Functional? 331

Physiological Studies of Color

Appearance 334

Reasoning about the Cortex

and Perception 335

Summary and

Conclusions 337

Exercises 338

10 Motion and Depth 341

Computing Motion 344

Stimulus Representation:

Motion Sampling 345

The Window of Visibility 347

Image Motion

Information 351

The Motion Gradient

Constraint 354

Space-Time Filters and

the Motion Gradient

Constraint 355

Depth Information in the

Motion Flow Field 357

Experimental Observations of Motion 359

Motion Gradients:

The Intersection of

Constraints 359

Contrast and Color	363
Long- and Short-Range Motion Processes	364
First- and Second-Order Motion	366
Stereo Depth	367
Depth without Edges	368
Depth with Edges	369
Head and Eye Movements	371
Vision During Saccadic Eye Movements	373
The Cortical Basis of Motion Perception	375
Acquired Motion Deficits	375
The Motion Pathway	376
Motion Perception and Brain Activity	380
Conclusion	384
Exercises	385

11 Seeing 387

Miracle Cures	388
Illusions	390
Seeing the Three-Dimensional World	391
Shadows and Edges	392
Shapes	395
Integrating Cues	398
Geometric Illusions	400
Summary	401

Appendixes

A Shift-Invariant Linear Systems 405

Shift-Invariant Linear Systems: Definitions	405
---	-----

Convolution	407
Convolution and Harmonic Functions	408
The Discrete Fourier Series: Definitions	409
The Discrete Fourier Series: Properties	410
Measurements with Harmonic Functions	412

B Display Calibration 413

An Overview of a CRT Display	413
The Frame-Buffer	414
The Display Intensity	415
The Display Spectral Power Distribution	416
The Calibration Matrix	418
Example Calculations	419
Color Calibration Tips	420
Spatial Independence	420
Phosphor Independence	421

C Classification 423

A Bayes Classifier for an Intensity Discrimination Task	425
A Bayes Classifier for a Pattern-Discrimination Task	426

D Signal Estimation: A Geometric View 431

Matrix Equations	434
------------------	-----

***E Motion-Flow-Field
Calculation 437***

Imaging Geometry and
Perspective Projection 438

Imaging Geometry:
Camera Translation and
Rotation 439
Motion Flow 439

***F A Sampling
and Aliasing
Demonstration 441***
