Preface	ix
Symbols	xii
Introduction	xiv
What is a shallow lake?	xiv
Management problems	xiv
Theory versus nature	xvii
Set-up of the book	xix
1 The story of some shallow lakes	1
1.1 Nutrient induced changes	1
Veluwemeer	1
Alderfen Broad	4
1.2 Storm effects	5
Lake Apopka	5
Lake Ellesmere	6
1.3 Water level changes	6
Tämnaren	6
Rice Lake	7
1.4 Fish stock management	8
Zwemlust	8
Linford Lakes	9
1.5 Miscellaneous cases	13
Lakes Tåkern and Krankesjön	13
Lagoon of the Islands	14
Lake Christina	15
Tomahawk Lagoon	18
2 The abiotic environment	20
2.1 Light under water	20
Absorption and scattering	20
Light attenuation with depth	21
Secchi-depth	23
Nephelometric turbidity	25
Euphotic depth	25
Finding the causes of turbidity	26
Pragmatic solutions to estimate light attenuation	30

2.2	Sedimentation and resuspension	31
	The balance of resuspension and sedimentation	31
	When and where wave resuspension occurs	33
	Wave resuspension in relation to lake size and depth	36
	Lake specific empirical models	41
	Sediment resuspension by fish	44
	The effect of vegetation on sedimentation and resuspension	47
2.3	Nutrient dynamics	49
	The availability of phosphorus	50
	Sediment as a phosphorus buffer	52
	The mechanisms that govern sediment phosphorus release	56
	Nitrogen dynamics	61
	Carbon as a limiting nutrient	64
	The effect of algae and macrophytes on nutrient dynamics	64
	The effect of animals on nutrient dynamics	70
3	Phytoplankton	76
3.1	The regulation of algal biomass	76
	Empirical relationships between chlorophyll and nutrients	76
	The logistic equation as a model of algal growth	79
	Losses due to sinking and flushing	81
	Lake depth and light limitation	85
	The combined effects of nutrients and light	89
	Phytoplankton control by grazers	96
	Allelopathic effects	97
3.2	Competition between algae and cyanobacteria	99
	Empirical relationships with nutrients and turbidity	101
	Hysteresis as an implication	105
	Competition as an explanation	107
	Other mechanisms involved	114
3.3	Multi-species competition and succession	116
	Causes of non-equilibrium dynamics	117
	Reasons to expect chaotic dynamics	118
4	Trophic cascades	122
4.1	Top-down control of phytoplankton	124
	Grazing by mussels	124
	The special position of <i>Daphnia</i>	127
	A minimal plankton model	129
	The paradox of enrichment	134
	Stabilizing mechanisms	137
	Implications of spatial heterogeneity	138
4.2	The effect of planktivorous fish	146
	Field observations and experimental results	146
	The classical consumption catastrophe	148

	A minimal model of planktivory	152
	Hysteresis in the response to fish	152
	Implications of oscillations	156
	An inventory of theoretical possibilities	158
4.3	Seasonal dynamics of plankton and fish	162
	The spring clear-water phase	163
	Other seasonal scenarios	166
	Patterns across many lakes	168
	The seasonal cycle of planktivory	172
	Modelling seasonality of plankton	174
	Implications of seasons for equilibria and cycles	177
	Behaviour of the seasonal plankton model	181
	But many more mechanisms operate in the field	184
4.4	The benthic connection	190
	Importance of benthos in shallow lake food webs	190
	Competition for benthic food	191
	Top-down control of snails and periphyton	193
4.5	Piscivores	197
	Impact on fish abundance and size	197
	How far down does the cascade go?	200
	Cannibalism and competition	201
4.6	General patterns	203
	Body-size as a key factor	203
	Predation avoidance: costs and consequences	205
	Shifts in food-web structure with enrichment	206
5	Vegetation	210
5.1	Implications of vegetation for the animal community	213
	Invertebrates	214
	Zooplankton	216
	Fish	222
	Birds	224
5.2	Effect of vegetation on turbidity	225
	Correlations and causality	225
	Seasonal dynamics	229
	Case studies revealing mechanisms	233
	Are there general patterns?	237
	Brackish lakes as an exception	241
5.3	The regulation of vegetation abundance	245
	Turbidity and water depth	245
	Periphyton	250
	Temperature	253
	Substrate and nutrients	253
	Wave action	254
	Birds	256

	Fish	257
5.4	Vegetation and phytoplankton dominance	
	as alternative equilibria	258
	Stabilizing mechanisms	258
	A simple graphical model	260
	The vegetation-turbidity interaction elaborated	263
	Hysteresis as an implication	266
	A minimal mathematical model	269
	Predictions from a mechanistic vegetation model	273
	Implications of seasonality	279
	Other mechanisms influencing the hysteresis	281
	Hallmarks of hysteresis	284
	A review of evidence from the field	286
6	Managing the ecosystem	289
6.1	Implications of alternative stable states	289
	Stability properties	289
	Eutrophication and restoration	291
	Connected and heterogeneous lakes	293
6.2	Nutrient management	294
	How nutrient loading affects the system	294
	Different approaches to reduce nutrients	296
6.3	Biomanipulation	296
	Biomanipulation as a shock therapy	297
	Requirements for success	298
6.4	Hydrological adjustments	300
	Water level manipulation	300
	Draw-down	301
	Flushing	302
6.5	Other measures	303
	Barley-straw	303
	Dredging	303
	Enclosures and artificial refuges	304
	Handling vegetation nuisance	304
6.6	Selecting restoration measures	306
7	The limits of knowledge	308
	Problems of predictive mechanistic models	308
	The necessity of mechanistic insight	310
	Prospect	312
	References	314
	Lake index	344
	Subject index	346
