Preface	vii
List of Contributors	ix
Other Volumes in the Series	xxiii

Chapter 1. Chromatin structure and dynamics: a historical perspective

<i>E. Morton Bradbury and K.E. van Holde</i>	1
1. Introduction	1
2. Advances in selected areas of chromatin research	1
2.1. Nucleosomes	1
2.1.1. The core particle	1
2.1.2. The chromosome, and the role of the lysine-rich histones	2
2.1.3. Nucleosome assembly	3
2.2. Higher-order chromatin structure	3
2.3. Histones	4
2.3.1. Histone sequences and variants	4
2.3.2. Histone modifications	6
2.3.3. Histone-histone interactions	6
2.4. Chromatin and transcription	7
3. Conclusions and overview	8
References	9

Chapter 2. The core particle of the nucleosome

<i>Joel M. Harp, B. Leif Hanson and Gerard J. Bunick</i>	13
1. Introduction	13
2. Toward higher resolution nucleosome structure	16
3. Units of nucleosome structure	20
4. Structure of the core histones	22
5. DNA structure	25
6. DNA-histone binding	29
7. Surface features of the NCP	30
8. Translation, libration, and screw-axis motions of NCP elements	34
9. Crystal packing features of NCP and implications for higher order chromatin structure	39
References	43

Chapter 3. Paradox lost: nucleosome structure and dynamics by the DNA minicircle approach

<i>Ariel Prunell and Andrei Sivolob</i>	45
1. Introduction: the linking number paradox and DNA local helical periodicity on the histone surface	45
2. Early topological studies: a single nucleosome on a DNA minicircle	48
3. Polymerase-induced positive supercoiling and linker positive crossing in nucleosomes	52
4. A nucleosome on an homologous series of DNA minicircles: a dynamic equilibrium between three distinct DNA conformational states	53
4.1. Qualitative analysis	53
4.2. Quantitative analysis	56
4.2.1. Topology: general equations	56
4.2.2. Energetics	56
4.2.3. Loop most probable conformations and elastic supercoiling free energies	58
4.3. DNA sequence-dependent nucleosome structural and dynamic polymorphism. A role for H2B N-terminal tail proximal domain	62
5. Nucleosomes in chromatin: a dynamic equilibrium	63
5.1. A displaceable equilibrium	63
5.1.1. Supercoiling constraints	63
5.1.2. Histone acetylation. Toward an invariant of chromatin dynamics: the ΔLk -per-nucleosome parameter	64
5.2. Superstructural context of nucleosome dynamics in chromatin	65
5.3. Topology and dynamics of linker histone-containing nucleosomes in chromatin	66
6. Conclusions	67
Acknowledgement	68
References	68

Chapter 4. The linker histones

<i>A. Jerzmanowski</i>	75
1. Introduction	75
2. Core and linker histones: a common name for different proteins	75
3. Linker histones and chromatin structure	77
3.1. Mode of binding and location of histone H1 in the nucleosome	77
3.2. Linker histones and higher order chromatin structures	81
3.3. Dynamic character of H1 binding to chromatin	83

4. Variability of linker histones	85
4.1. Evolutionary perspective	85
4.2. Biological significance of H1 diversity—evidence from biochemical and molecular studies	90
5. Functional analysis of the role of linker histones in cells and organisms . .	91
5.1. Function of linker histones in simple eukaryotes	92
5.2. Function of linker histones in complex multicellular eukaryotes . .	93
5.2.1. Experiments employing cell lines	93
5.2.2. Experiments employing whole organisms	94
6. Conclusions and perspectives	96
Acknowledgements	98
References	98

Chapter 5. Chromosomal HMG-box proteins

<i>Andrew A. Travers and Jean O. Thomas</i>	103
1. Introduction	103
2. Structure and DNA binding	104
2.1. The HMG-box domain	104
2.2. DNA binding	105
2.2.1. Structural basis for DNA binding and bending	105
2.2.2. Binding to distorted DNA structures	107
2.2.3. Role of the basic region in DNA binding	109
2.2.4. Role of the acidic region	111
2.2.5. Structural basis for non-sequence-specific DNA recognition	112
3. HMGB function	112
3.1. DNA bending as a major feature	112
3.2. HMGB proteins and chromatin structure	113
3.3. Nucleosome assembly and remodeling	115
3.4. HMGB proteins and transcription	118
3.4.1. Effects at the level of chromatin	118
3.4.2. Interactions with transcription factors	119
3.5. HMGB proteins and DNA repair	123
3.6. Post-translational modifications of HMGB proteins	123
4. Other functions for HMGB proteins	124
Acknowledgements	125
References	125

Chapter 6. The role of HMGN proteins in chromatin function

<i>Katherine L. West and Michael Bustin</i>	135
1. Introduction	135
2. Members of the HMGN family	135
2.1. Conservation between HMGN family members	136
2.2. Genomic organization of HMGN family members	136

3. Interaction of HMGN proteins with the nucleosome core particle	138
4. Interaction of HMGN proteins with nucleosome arrays	141
5. Post-transcriptional modification of HMGN proteins	142
5.1. Phosphorylation	142
5.2. Acetylation	143
6. Activation of transcription by HMGN proteins <i>in vitro</i>	144
7. Models for chromatin unfolding by HMGN proteins	145
7.1. Interaction with core histone tails	145
7.2. Counteracting linker histone compaction	145
8. Association of HMGN proteins with transcription <i>in vivo</i>	146
9. Tissue-specific expression of <i>HMGN</i> family members <i>in vivo</i>	148
10. Role of HMGN proteins <i>in vivo</i>	149
11. Conclusions	150
Abbreviations	151
References	151

Chapter 7. HMGA proteins: multifaceted players in nuclear function

<i>Raymond Reeves and Dale Edberg</i>	155
---	-----

1. Introduction	155
2. Biological functions of HMGA proteins	155
3. HMGA proteins: flexible players in a structured world	157
4. HMGA biochemical modifications: a labile regulatory code	160
5. HMGA proteins, AT-hooks and chromatin remodeling	166
6. HMGA proteins as potential drug targets	170
6.1. Methods to lower the cellular concentrations of HMGA proteins	170
6.2. Drugs that non-specifically compete with AT-hooks peptides for DNA-binding	171
6.3. Drugs that block binding of HMGA proteins to specific gene promoters	172
6.4. Drugs that specifically inactivate or cross-link HMGA proteins <i>in vivo</i>	173
7. Conclusions	175
Abbreviations	176
References	177

Chapter 8. Core histone variants

<i>John R. Pehrson</i>	181
----------------------------------	-----

1. CENP-A	181
1.1. Sequence comparisons	182
1.2. Nucleosomes	183
1.3. Centromeric localization	183
1.4. Function	184

3.2.8. H4 Arg-3 methyltransferase	225
3.2.9. Ash1, a multi-site histone methyltransferase	225
3.3. Histone methyltransferases, HATs, HDACs, and DNA methyltransferases	225
4. Histone ubiquitination	227
5. Histone ubiquitination and histone methylation—trans-histone regulatory pathway	229
6. Histone ADP-ribosylation	230
References	231

*Chapter 10. The role of histone variability in chromatin
stability and folding*

<i>Juan Ausió and D. Wade Abbott</i>	241
1. Introduction	241
2. Brief introduction to histone variants	242
2.1. Histone H2AX	242
2.2. Histone H2A.Z	245
2.3. MacroH2A	245
2.4. H2A-Bbd	246
2.5. Centromeric variants	247
2.6. Histone H1 micro- and macroheterogeneity	248
3. Brief introduction to post-translational modifications	249
3.1. Histone acetylation	252
3.2. Histone phosphorylation	254
3.3. Histone methylation	255
3.4. Histone ubiquitination	257
3.5. Histone polyADP-ribosylation	258
4. Brief introduction to DNA methylation	259
5. Chromatin folding and dynamics	260
5.1. Nucleosome stability	261
5.1.1. The role of DNA	264
5.1.2. The role of histones	266
5.2. Chromatin fiber folding	267
6. Histone variation and chromatin stability. A few selected examples	269
6.1. Histone H2A.Z	270
6.2. Histone acetylation	272
6.2.1. The structure of the acetylated nucleosome core particle	272
6.2.2. Is the acetylated chromatin fiber unfolded?	275
6.3. Histone H2A ubiquitination	275
7. Concluding remarks	279
References	279

Chapter 11. Nucleosome modifications and their interactions; searching for a histone code

<i>Bryan M. Turner</i>	291
1. The importance of residue-specific modifications	292
2. Dynamics of histone modification	294
3. Modifications interact <i>in cis</i>	295
4. Modifications interact <i>in trans</i>	296
5. Interplay between histone modifications and DNA methylation	298
6. Short-term changes; transcription initiation	299
7. Long-term effects	300
8. A molecular memory mechanism	301
9. What should we expect of a histone code?	302
References	304

Chapter 12. DNA methylation and chromatin structure

<i>Jordanka Zlatanova, Irina Stancheva and Paola Caiafa</i>	309
1. Introduction	309
2. DNA methylation: the biology	311
2.1. The distribution of methylated CpGs in the genome is not random	311
2.2. The enzymatic machinery involved in governing the DNA methylation status	317
2.3. Methyl-CpG binding proteins	319
2.4. DNA methylation and human disease	322
3. DNA methylation and transcriptional regulation: the phenomenology	322
4. DNA methylation, insulators, and boundaries of chromatin domains	325
5. Chromatin and DNA methylation	327
5.1. The histone acetylation link	327
5.2. The histone methylation link	330
5.3. The poly(ADP-ribosylation) link	332
5.4. DNA methylation and chromatin structure: beyond the post-synthetic modifications of histones and other proteins	333
6. Concluding remarks	335
Acknowledgements	336
References	336

Chapter 13. Chromatin structure and function: lessons from imaging techniques

<i>David P. Bazett-Jones and Christopher H. Eskiw</i>	343
1. Introduction	343
2. Microscopy: a complementary approach	343

2.1. Microscopical approaches	344
2.1.1. Transmission electron microscopy (TEM)	344
2.1.2. Scanning force microscopy	345
2.1.3. Fluorescence microscopy	346
3. Imaging of modified and functionally engaged nucleosomes	347
3.1. Imaging acetylated nucleosomes	347
3.2. Imaging transcriptionally active nucleosomes	347
3.3. Imaging remodeled nucleosomes	349
3.4. Imaging exchange of core and linker histones	350
4. Perspectives on the organization of the 30-nm fiber from imaging approaches	352
5. Chromatin organization in the nucleus	355
5.1. Nuclear positioning of transcribed genes	357
5.2. Role of sub-nuclear domains in establishing nuclear activity	357
5.3. Dynamics of exchange of regulatory factors with transcriptionally active genes	360
5.4. Imaging condensation/decondensation as a function of gene activity	361
6. Summary	363
References	364

Chapter 14. Chromatin structure and dynamics: lessons from single molecule approaches

<i>Jordanka Zlatanova and Sanford H. Leuba</i>	369
1. Introduction	369
2. Atomic force microscope imaging of chromatin fibers	370
2.1. AFM assessment of chromatin organization	371
2.2. AFM studies of biochemically manipulated or reconstituted chromatin fibers	378
2.3. AFM assessment of structural effects of histone post-translational modifications	380
2.4. AFM visualization of salt-induced chromatin fiber compaction	381
3. Chromatin fiber assembly under applied force	382
4. Chromatin fiber disassembly under applied force	387
5. Summary	393
Acknowledgements	393
References	394

Chapter 15. Theory and computational modeling of the 30 nm chromatin fiber

<i>Jörg Langowski and Helmut Schiessel</i>	397
1. Introduction	397
2. Physical properties of nucleosomes and DNA	399

3. Computational implementation	400
4. Energetics: coarse-graining and interaction potentials	401
5. Mechanics of the chromatin fiber	402
5.1. The “two angle” model—basic notions	403
6. The chromatin chain at thermodynamic equilibrium	408
6.1. Metropolis Monte-Carlo	408
6.2. Brownian dynamics simulation	409
7. Monte-Carlo modeling of the chromatin fiber	410
7.1. Simulation of chromatin stretching	411
8. Dynamic simulations of the chromatin fiber	413
8.1. Brownian dynamics models of the chromatin fiber	413
9. The flexibility of the 30 nm fiber	414
9.1. Conclusion	415
References	416

Chapter 16. Nucleosome remodeling

<i>Andrew A. Travers and Tom Owen-Hughes</i>	421
1. Introduction	421
2. Nucleosome mobility	421
3. Interactions of remodeling complexes	430
3.1. Common motifs and subunits in remodeling complexes	431
3.2. Interactions between remodeling complexes and nucleosomes	433
4. Mechanism of remodeling	433
4.1. The mechanics of remodeling	433
4.2. DNA translocation and chromatin remodeling	436
4.3. The DNA topology of remodeling	440
4.4. Nucleosome “priming”	441
4.5. An active role for core histones in remodeling?	442
5. Biological functions of chromatin remodeling	444
5.1. General functions of remodeling complexes	445
5.2. Targeting of remodeling complexes	446
5.3. Nucleosome remodeling during transcription	447
5.4. Regulation of remodeling complexes	448
6. Endnote	449
Acknowledgements	449
References	449

Chapter 17. What happens to nucleosomes during transcription?

<i>Vaughn Jackson</i>	467
1. Introduction	467
2. <i>In vivo</i> studies of transcription on nucleosomes	467
2.1. Nuclease studies	467
2.2. Histones of active genes	469
2.3. <i>In vivo</i> nucleosomal dynamics	472

3. <i>In vitro</i> studies of transcription on nucleosomes	474
3.1. The eucaryotic polymerases	474
3.2. The procaryotic polymerases	475
3.3. The "spooling" model	476
3.4. The "disruptive" model	479
3.5. Transcription-induced topological effects	480
3.6. Histone chaperones that release H2A, H2B	481
3.7. The chiral transition of H3, H4	484
3.8. Histone acetylation	485
3.9. Histone H1	486
4. Summary	487
References	488
Subject Index	493
