Part I. Core Development and Genetics

1	A developmental genetic model for the origin of the flower	3
	DAVID A. BAUM and LENA C. HILEMAN	
1.1	Introduction	3
1.2	What is a flower?	4
1.3	Phylogenetic and paleontological context	5
1.4	Evolutionary novelties of the flower	6
	1.4.1 Bisexuality	6
	1.4.2 Determinate/compressed axes	7
	1.4.3 Perianth	7
1.5	Ordering the key steps in floral evolution	8
1.6	Developmental genetic background	9
	1.6.1 Position and identity of the reproductive organs	9
	1.6.2 Developmental regulation of the perianth	13
1.7	Models for the origin of bisexuality	14
1.8	Apical megasporophyll production on a microsporangiate axis?	16
1.9	The compression of the floral axis	18
1.10	The evolution of the perianth	19
1.11	The origin of a dimorphic perianth	20
1.12	Conclusion	21
	References	22
2	Floral induction	28
	REYNALD TREMBLAY and JOSEPH COLASANTI	
2.1	Introduction	28
2.2	Floral transition is marked by developmental phase changes	28
2.3	Floral induction is mediated through multiple pathways	30
2.4	Photoperiodic floral induction provides a cue to seasonal changes	31
	2.4.1 Photoreceptors transduce light signals	31
	2.4.2 The circadian clock is self-reinforcing	32
	2.4.3 Key genes integrate photoperiodic induction	32

2.4.4	CO and FT gene function is conserved in other plant species	34
2.4.5	Photoperiod induction through CO-independent pathways	35
2.5	Autonomous pathway	36
2.5.1	FLOWERING LOCUS C integrates different floral inductive pathways	36
2.6	Vernalization	38
2.6.1	Mediation of vernalization in Arabidopsis by FLC repression	38
2.6.2	Vernalization in cereals	40
2.7	Hormones and other factors	41
2.7.1	Nutrient diversion theory of floral induction	41
2.7.2	Gibberellin	42
2.7.3	Long-distance floral inductive signals	44
2.7.4	Integration and commencement of the floral transition	45
2.7.4.1	LEAFY and APETALA1	45
2.7.4.2	TERMINAL FLOWER 1	45
2.7.4.3	Conservation of LFY function in higher plants	45
2.8	Perspective	46
	References	46
3	Floral patterning and control of floral organ formation	49
	ELENA M. KRAMER	
3.1	Introduction	49
3.2	The ABC model of floral organ identity	49
3.2.1	The major genetic players in the ABC model	50
3.2.2	Members of the MADS-box transcription factor family	51
3.2.2.1	Redundant and complex functions among the floral MIKC MADS-box genes	53
3.2.3	Members of the AP2/EREBP transcription factor family	55
3.3	Regulating the expression of the floral organ identity genes	56
3.4	Conservation and modification of the ABC program	58
3.4.1	Floral organ identity gene function in Petunia	58
3.4.2	Floral organ identity gene function in Oryza	60
3.5	Sex determination as a modification of floral organ identity	62
3.6	Future perspectives	63
	References	64
4	The genetic control of flower size and shape	71
	LYNETTE FULTON, MARTINE BATOUX, RAM KISHOR YADAV and KAY SCHNEITZ	
4.1	Introduction	71
4.2	Flower primordium outgrowth	73

4.3	Regulating flower meristem size	74
4.3.1	Cell–cell communication, pattern formation in the meristem and meristem size	75
4.3.2	Cellular factors regulating floral meristem development	77
4.4	Early control of organogenesis in the flower	79
4.5	Generating organ boundaries	82
4.6	Floral organ size	84
4.7	Flower shape and symmetry	86
4.7.1	Floral determinacy	86
4.8	Dorsoventral symmetry	88
4.8.1	Petal asymmetry and contort aestivation	90
4.9	Outlook: to boldly go where no one has gone before ...	91
	References	92

5 Inflorescence architecture – Moving beyond description to development, genes and evolution 98

SUSAN R. SINGER

5.1	Overview	98
5.2	Inflorescence typologies	98
5.3	Inflorescence development	104
5.3.1	Inflorescence meristem	104
5.3.2	Regulating determinacy	105
5.3.3	Regulating meristem identity	108
5.4	Evolution of inflorescence architecture	108
5.4.1	Teosinte	108
5.4.2	Cauliflower and Broccoli	109
5.4.3	Phenotypic plasticity	110
5.5	Future directions: modeling inflorescence architecture	111
	References	111

Part II. Specialised Components of Development

6 Close, yet separate: patterns of male and female floral development in monoecious species 117

RAFAEL PERL-TREVES and PREM ANAND RAJAGOPALAN

6.1	Introduction	117
6.2	Ecological and evolutionary aspects of monoecious plant development	118
6.2.1	Evolution of diverse reproductive strategies in land plants	118
6.2.2	Selective forces that favor the evolution of unisexual flowers	119
6.2.3	Flexibility in sex ratios in monoecious plants	119
6.2.4	Relationship between monoecy and pollination	121

6.2.5	The andromonoecious option: more compromises?	121
6.3	How do unisexual flowers develop?	122
6.3.1	Structural differences between male and female flowers	122
6.3.2	Unisexual flower development in maize	123
6.3.2.1	Development of the male and female florets	123
6.3.2.2	Mutations that affect stamen development: role of gibberellin	124
6.3.2.3	Mutations that affect pistil abortion	126
6.3.2.4	Cytokinin counteracts pistil abortion	127
6.3.2.5	Conservation of the maize sex determination pathway in other species	128
6.3.3	Unisexual flower development in cucumber	129
6.3.3.1	Cucumber as an experimental model for sex expression	129
6.3.3.2	Sex expression in the cucumber bud and along the shoot	129
6.3.3.3	Inheritance of sex in cucumber	130
6.3.3.4	Environmental and hormonal regulation of sex expression	131
6.3.3.5	A model for cucumber sex expression	132
6.3.3.6	Molecular studies on ethylene-synthesis and perception genes in <i>Cucumis</i>	134
6.3.3.7	Search for 'effector genes' that carry out the developmental program following sex determination	138
6.4	Concluding remarks	141
	References	142
7	Cytoplasmic male sterility	147
	FRANÇOISE BUDAR, PASCAL TOUZET and GEORGES PELLETIER	
7.1	Introduction	147
7.2	Pioneering work in plant sexuality and hybridisation	147
7.3	Early studies of CMS	148
7.4	Definition of CMS as a system with two genetic determinants	149
7.5	Use of CMS in hybrid seed production	150
7.6	The search for CMS: intraspecific crosses, alloplasmic situations and cybrids	153
7.7	Spontaneous CMSs result from genomic conflict between nuclear and cytoplasmic genes	156
7.8	Molecular studies on CMSs: a step towards understanding or confusion?	159
7.8.1	The Texas story	159
7.8.2	Identification of CMS genes	161

7.8.3	The mechanisms underlying male sterility	164
7.8.4	Nuclear restorers and mechanisms of restoration to fertility	166
7.9	Conclusion and prospects	168
	References	170
8	The diversity and significance of flowering in perennials	181
	THERESA TOWNSEND, MARIA ALBANI, MIKE WILKINSON, GEORGE COUPLAND and NICK BATTEY	
8.1	Introduction	181
8.2	The importance of perenniality	181
8.3	Flowering in the context of perenniality	182
8.4	Raunkiaer's five life form groups: deeper and deeper connections between flowering and perenniality	183
8.4.1	The Ravenelle wallflower – timing is everything	183
8.4.2	Arabidopsis and its perennial relatives – timing with a spatial dimension	185
8.4.3	Apple – the mystery of the bourse	188
8.4.4	Strawberry – an overwintering crown and a summer of environmental sensing	189
8.4.5	Perennial grasses, leafy spurge – cryptophytes where the rhizome is crucial	191
8.5	Conclusion	194
	References	195

Part III. A Developmental Genetic Model for the Origin of the Flower

9	Flower colour	201
	YOSHIKAZU TANAKA and FILIPPA BRUGLIERA	
9.1	Introduction	201
9.2	Flower colour	202
9.3	The pigment classes	202
9.3.1	Betalains	202
9.3.2	Carotenoids	205
9.3.3	Flavonoids	207
9.4	Anthocyanin structure and flower colour	207
9.5	Complexity of blue flowers	208
9.6	Biosynthesis of flavonoids	210
9.6.1	Phenylpropanoid pathway	210
9.6.2	Main pathway leading to anthocyanidin 3-glucoside	212
9.6.3	Flavanones to flavones	212
9.6.4	Dihydroflavonols to flavonols	212
9.6.5	Hydroxylation of B-ring	213

9.6.6	Modification of anthocyanins	213
9.6.7	Transcriptional regulation	215
9.6.8	Regulation of vacuolar pH	216
9.7	Flower colour and mutations	216
9.7.1	Petunia	217
9.7.2	Ipomoea	217
9.8	Evolutionary aspects of structural genes in the flavonoid pathway	218
9.9	Genetic engineering of flower colour	222
9.9.1	Petunia	223
9.9.2	Torenia	225
9.9.3	Carnations	226
9.9.4	Roses	227
9.9.5	Chrysanthemums	228
9.9.6	Other plant species	229
9.9.7	Challenges to generate yellow flowers	229
9.10	Concluding remarks	230
	References	231

10 Floral scent: biosynthesis, regulation and genetic modifications **240**

JENNIFER SCHNEPP and NATALIA DUDAREVA

10.1	Introduction	240
10.2	Biological functions of floral scents	240
10.3	Biosynthesis of floral volatiles	241
10.3.1	Terpenes	242
10.3.2	Phenylpropanoids/benzenoids	245
10.3.3	Fatty acid derivatives	246
10.4	Genes responsible for scent production	246
10.5	Regulation of floral scent accumulation and emission	247
10.6	Genetic engineering of floral scent	250
10.7	Conclusions	252
	References	252

Part IV. Senescence

11 Flower senescence: fundamental and applied aspects **261**

ANTHONY D. STEAD, WOUTER G. VAN DOORN, M. L. JONES
and C. WAGSTAFF

11.1	Why senesce?	261
11.2	Defining senescence	263
11.2.1	Patterns of senescence	263
11.3	Applied means of controlling senescence in cut flowers	264
11.3.1	Mechanisms controlling senescence and/or abscission	264

11.3.2	Water	265
11.3.2.1	Vascular blockage	265
11.3.3	Inorganic nutrients	266
11.3.4	Carbohydrates	266
11.3.5	Plant growth regulators	269
11.3.5.1	Ethylene	269
11.3.5.2	Cytokinin and gibberellin	269
11.3.5.3	Other plant growth regulators	270
11.4	The molecular basis of senescence	272
11.5	Molecular events characterising floral senescence	278
11.6	Autophagy	279
11.6.1	Programmed cell death and apoptosis	281
11.7	Progress on manipulating flower senescence using GM	282
11.8	The future	283
11.8.1	Improved longevity	283
11.8.2	Gene function and control of senescence	284
11.8.3	Opportunities for 'quality control'	284
11.9	Conclusions	285
	References	285
	Index	287
