

Contents

I. Introduction	1
A. Definition	1
B. Historical Perspective	2
II. Fundamental Aspects	7
A. General Characteristics	7
B. Nuclear Plasmids	13
1. <i>Saccharomyces cerevisiae</i> – the 2 μ m Plasmid	13
2. <i>Dictyostelium discoideum</i> – a Cobalt Resistance Plasmid	21
3. <i>Drosophila melanogaster</i> – the Transposable Element Copia	23
C. Mitochondrial Plasmids	27
1. <i>Podospora anserina</i> – the Senescence Plasmid	27
2. <i>Neurospora crassa</i> – the Stopper and Poky Plasmids	34
3. <i>Neurospora crassa</i> – the Mauriceville Plasmid; <i>Neurospora intermedia</i> – the Labelle and Fiji Plasmids	37
4. <i>Claviceps purpurea</i>	41
5. Other Fungi	44
6. Higher Plants	48
D. Unknown Association	53
III. Practical Implications	57
A. Fundamentals for Eukaryotic Gene Cloning	58
1. Generalized Vector	59
2. Choice of an Appropriate Host Cell	64
B. Plasmids for Gene Cloning	65
1. The 2 μ m Plasmid of <i>Saccharomyces cerevisiae</i>	65
2. Ribosomal DNA Plasmids	68
3. The Senescence Plasmid of <i>Podospora anserina</i>	69
4. The Labelle Plasmid of <i>Neurospora intermedia</i>	69
5. The Mitochondrial Plasmid of <i>Cochliobolus heterostrophus</i>	70
6. The Transposable Elements of <i>Drosophila melanogaster</i>	70

C. Organellar DNA for Gene Cloning	71
1. Vectors Based on Confirmed Replication Origins	73
2. Vectors Based on Random DNA Segments as Origin of Replication	74
D. Maintenance of Vector Transferred Genes	79
1. Stabilization of Vectors in Host Cells	79
2. Efficient Expression of Cloned Genes	80
E. Biotechnological Perspectives	87
