

CONTENTS

1. Introduction

1—20

About Gene and its Definitions, Classic Concept of Gene, Location of Gene, Genes and Genome, Gene Size, Shape of Genes, Number of Genes, Gene Families and Pseudogenes, Life of Gene or Gene Stability, Role of Gene, Chemical Composition of Gene, Fine Structure of Gene, Cistron, Muton, Recon, Classification of Gene, Hypomorphs, Amorphs, Hypermorphs, Antimorphs, Neomorphs, Position Effect of the Gene, Structural Theory, Kinetic Theory, One Gene—One Enzyme Hypothesis, One Gene and Two Genes Theories, Overlapping and Included Genes, Broken or Split Gene, Jumping Genes, Longevity Genes, Cryptic Genes, Ultra Modern Concept of Gene, Cheating Genes, Gene Expression and Regulation, Other Types of Genes, Constitutive Genes (House Keeping Genes), Non-constitutive Genes (Luxary Genes), Inducible Genes, Repressible Genes, Repeated Genes, Pseudogenes, Processed Genes, Transposons, Tandem Clusters, Multigene Families, Dispersed Pseudogenes, Single-Copy Genes.

2. Chemistry of Gene

21—60

Deoxyribonucleic Acid or DNA, Physical Structure of DNA, Monomeric Components of DNA, Nucleosides, Nucleotides, Primary Structure of DNA, Molecular Weight of DNA, Secondary Structure of DNA, Various Forms of DNA, Tertiary Structure of DNA, Types of DNAs, Eukaryotic DNA, Prokaryotic DNA, Extranuclear DNA, Unique DNA, Repetitive DNA, Satellite DNA, Fold-back DNA, Z-DNA or Left Handed DNA, Tautomeric Form of DNA, Denaturation and Renaturation of DNA, Single-

Stranded DNA, Helix-coil Transition, Renaturation of DNA, Single-Stranded DNA or Viral Chromosomes, Structure of Single-stranded DNA, Rigorous Crystallography, The Chromosomes of Viruses, *E. coli*, and Yeast are Single DNA Molecules, Circular Versus Linear DNA molecules, Supercoiling of Circular DNA, Protein Containing Supercoils, DNA Supercoils Twice Around Each Nucleosome, Histone-like DNA-binding Proteins in Prokaryotes, Topoisomerases Change the Linkage Numbers of Super-coiled DNAs, Looped and Supercoiled Structure, Biological Replication of DNA, Mechanism of DNA Replication, Enzymes for DNA Synthesis, Nuclease Enzymes, DNA Polymerase, DNA Ligases, Types of Replication, Semiconservative, Conservative, Dispersive.

3. Recombination of Genes

61—90

Genetic Consequences of Crossing, The Genetic Constitution of Plants in Pair Crossing, Importance of Plant Percentage for Achieving Favourable Gene Combinations, Types of Crosses and Selection of Parents for Hybridization, Types of Crosses, Selection of Parents Based on Ecological Factors, Selection of Parents in Transgressive Breeding, Working with Hybrid Generations, Working with Hybrid Progenies of Self-Pollinated Plants, Working with Hybrid Progenies of Cross-Pollinated Plants, Working with Hybrid Progenies of Vegetatively Propagated Plants, Breeding Based on Different Types of Crosses, Backcross Method, Convergent Improvement Method, Step-by-Step Hybridization Method, Interhybrid Crossing, Genetic Maps of Chromosomes and their Importance for Plant Breeding.

4. Modification of Genes

91—126

Somaclonal Variation, Gene Transformation, Genetic Stability, Plant Development and Reproduction, Phytohormones Modification, Light Perception Modification, Root System and Rooting Ability Modification, Juvenility Modification, Fruit Quality, Oil Composition, Protein Modification, Carbohydrate Modification, Nutrients, Antibodies, Secondary Metabolites and Vaccines, Ripening and the Control of Flavour, Texture and Shelf-life, Fruit Size, Biotic Stress, Virus Resistance, Fungal Resistance, Bacterial Resistance, Nematode Resistance, Insect and Pest Resistance, Resistance to Herbicides, Abiotic Stress Resistance, Salt Stress, High pH Stress, Cold Stress, Genes

Encoding Enzymes for the Biosynthesis of Compatible Compounds, Enzymes for Scavenging Active Oxygen Species, Heat Shock Proteins (HSPs), Late Embryogenesis-abundant (LEA) Proteins, Enzymes Modifying Membrane Lipid Saturation, Transcription Factors, Proteins Required for Ion Homeostasis, Plant Breeding: The Use of Molecular Markers, Apple, Pear, Apricot, Peach, Citrus, Cherry, Grape, Future Perspectives.

5. Recombinant DNA 127—168

Separation of Particular DNA Fragments, Restriction Endonucleases, Nomenclature, Recognition Sites, Complementary DNA (cDNA), Vectors, Types of Vectors, Promoters in Vectors, Expression Cassettes, Expression Vectors, Production Vectors, Cloning in *E. coli*, Bacteriophages Vectors, Cosmids, Phasmid Vectors, Shuttle Vectors, Vehicles, Plasmids, Bacteriophages, The Role of Bacteria, Gene Libraries, Applications of Genetic Engineering, Commercial Possibilities, Uses in Research, Production of Eukaryotic Proteins, Genetic Engineering with Animal Viruses, Diagnosis of Hereditary Diseases.

6. Cloning of Genes 169—191

The Gene Addition Approach to Plant Genetic Engineering, Plants that Make their own Insecticides, Other Gene Addition Projects, Gene Subtraction, The Principle behind Antisense Technology, Antisense RNA and the Engineering of Fruit Ripening in Tomato, Problems with Genetically Engineering Plants, Safety Concerns with Selectable Markers, The Possibility of Harmful Effects on the Environment, Gene Cloning in Medicine, Production of Recombinant Pharmaceuticals, Recombinant Insulin, Recombinant Factor VIII, Recombinant Vaccines, Identification of Genes Responsible for Human Diseases, The Breast Cancer Gene BRCA1, Gene Therapy, Approaches to Gene Therapy, Ethical Question Raised by Gene Therapy.

7. Restriction Endonuclease 192—220

Made in *E. Coli*, Protection and Destruction, The Enzyme Isolated, Destroyer and Protector, Perverse Complexity, A Whole New Class, Recognition, Things Get Easier, The Naming of Parts, What they Do, What's it all for?

8. Gene Manipulation 221—236

Selection and Isolation of Genes, Transformation and Regeneration of Plants, DNA Delivery Systems, Selection and Analysis of Transformants, Plant Regeneration Systems, Stability of the Transgenes, Environmental Risk Assessment, Future Trends, Gene Targeting, Transformation of Recalcitrant Species, More 'Friendly' Selectable Markers: The Positive Selection Method, Use of More Appropriate Promoters.

9. Gene in Medicine 237—259

Interferon, The Wonder Drug, Because It is There: Synthetic Interferon, Immunization: Education for Protection, Foot and Mouth, Hepatitis and Other Problems, Cesar's Glory: Monoclonal Antibodies.

10. Application 260—289

Engineered Help for the Engineers, A Gaint Step: Anti-growth Hormone, A Little More Help: Growth Hormone, A Sweet Victory: Insulin, Close Second, Make the A Chain, Replacement for Real.

11. Genes in Resisting Disease 290—306

Existing Non-GM Approaches, Plant Pathogen Interactions, Prokaryotes, Fungi and Water Moulds, Viruses, Natural Disease Resistance Pathways—Overlap between Pests and Diseases, Anatomical Defences, Pre-existing Protein and Chemical Protection, Inducible Systems, Systemic Responses, Biotechnological Approaches to Disease Resistance, Protection against Fungal Pathogens, Antimicrobial Proteins, Induction of HR and SAR in Transgenic Plants.
