

CONTENTS

Preface	vii
List of Contributors	xi
1. Molecular Ecology: Origins and Approach	
GARY R CARVALHO	
1. Introduction: the approach of molecular ecology	1
2. Molecular ecology: what do we mean?	2
3. Molecular ecology: a new term for an established field	5
4. The DNA era: advances in technology	7
5. Descriptive and mechanistic molecular ecology	10
6. The molecular genetic toolbox: choices and applications	11
7. Concluding remarks and future priorities	15
References	16
2. Phylogenetic Analysis of Frequency Data in Molecular Ecological Studies	
DAVID M HILLIS	
1. Introduction	25
2. Optimality criteria and search algorithms	26
3. Selecting an appropriate distance measure	27
4. The step matrix	29
5. Step matrices with frequency data	31
6. An example using PAUP	33
7. Extensions to ecological and behavioural characters	34
8. Conclusions	37
References	37
3. Estimation of Migration Rates and Population Sizes in Geographically Structured Populations	
PETER BEERLI	
1. Introduction	39
2. How to compare different population parameter estimators	41
3. Migration rate estimators based on F -statistics	42
4. Maximum likelihood estimators based on allele frequencies	46
5. Estimators using the coalescent	47
6. Variable mutation rate	50
7. Testing whether migration rates are symmetric	51
8. Discussion	51
9. Conclusion	51
References	52

4. Microsatellites and Minisatellites for Molecular Ecology: Theoretical and Empirical Considerations

ARNAUD ESTOUP & BERNARD ANGERS

1. Introduction	55
2. Qualitative, quantitative and technical features	56
3. Mutation processes	60
4. Analyses at the individual level	65
5. Analysis at the population level	70
6. Conclusions and future prospects	78
References	79

5. Structure, Function and Dynamics of Microbial Communities: the Molecular Biological Approach

GERARD MUYZER

1. Introduction	87
2. Cloning of 16S rRNA encoding genes	91
3. Ribosomal RNA slot-blot hybridization	92
4. <i>In situ</i> hybridization	96
5. <i>In situ</i> PCR	98
6. Genetic fingerprinting of microbial communities	98
7. Limitations of molecular techniques in microbial ecological studies	106
8. Retrieval of useful information from complex mixtures of microorganisms	107
9. Concluding remarks and future directions	108
References	109

6. Bacterial Evolution and the Nature of Species

J PETER W YOUNG

1. Who needs species?	119
2. Why are there species?	119
3. Why are bacteria interesting?	120
4. How do bacteriologists define bacterial species?	120
5. What do we know about the phylogeny of bacteria?	121
6. Do bacteria have sex?	122
7. How effective is bacterial sex?	125
8. Are bacterial species maintained by genetics or by ecology?	128
References	129

7. Ancient DNA: Problems and Perspectives for Molecular Microbial Palaeoecology

FRANCO ROLLO

1. Brief historical background	133
2. Unravelling a specimen's history	135
3. How long can DNA last?	136
4. The "Archaeometric" approach	139
5. Perspectives for molecular microbial palaeoecology	141
6. Future perspectives	146
References	147

8. Clonal Organisms and the Benefits of Sex

ROBERT C VRIJENHOEK

1. Introduction	151
2. Why have sex?	153
3. Why not clone?	159
4. Ancient clones?	162
5. Summary and conclusions	164
References	167

9. Parentage Analysis in Plants: Mating Systems, Gene Flow, and Relative Fertilities

ANDREW SCHNABEL

1. Introduction	173
2. Mating system analysis	174
3. Exclusion analysis and gene flow estimation	176
4. Methods for estimation of relative male and female fertilities	180
5. Practical considerations in parentage studies	183
6. Future directions in the use of parentage analysis	184
References	186

10. Population Identification in Pelagic Fish: the Limits of Molecular Markers

LORENZ HAUSER & ROBERT D WARD

1. Introduction	191
2. Genetic population structure and the definition of units for fisheries management	193
3. Ecological factors affecting patterns of genetic diversity in pelagic fish	194
4. Molecular approaches to the identification of pelagic fish populations	205
5. Summary and concluding remarks	214
References	216

11. Molecular Markers and Natural Selection

JEFFRY B MITTON

1. Introduction	225
2. Recent examples of selection detected by molecular markers	231
3. Discordant patterns of geographic variation	234
4. Sexual selection and the privilege of the heterozygous male	235
5. Summary	238
References	238

12. Molecular Ecology of Hybridization

LOREN H RIESEBERG

1. Introduction	243
2. Concepts and terminology	244
3. Molecular markers	245
4. Structure and dynamics of hybrid zones	247
5. Phylogeography of hybridization	250
6. Hybrid zones and the genetic architecture of reproductive isolation	251
7. Outcomes of hybridization	253
8. Conclusions and future directions	260
References	261

13. Variable Environments and Evolutionary Diversification in Inland Waters

PAUL D HEBERT

1. Introduction	267
2. Varied rates of molecular evolution - analytical artefacts and biological effects	268
3. Varied rates of morphological divergence: an overview	273
4. Morphological transitions - a paleontological perspective	281
2825. Morphological transitions - a neontological perspective	282
6. The environment and evolution	283
7. Future studies	284
References	285

14. A Guide to Software Packages for Data Analysis in Molecular Ecology

ANDREW SCHNABEL, PETER BEERLI, ARNAUD ESTOUP & DAVID M HILLIS

1. Introduction	291
2. Relationships among individuals: parentage and relatedness	291
3. Relationships among populations: population genetic structure and gene flow	292
4. Relationships among species: phylogeny reconstruction	294
References	294
Appendices	297

Glossary of Terms

305
