|------------------------------------------------------------------------------------------|------------|
| <b>Preface</b> .....                                                                     | <b>xix</b> |
| <b>Notes</b> .....                                                                       | <b>xxv</b> |
| <b>Chapter 1: Prologue: Signal Transduction, Origins, and Ancestors</b> .....            | <b>1</b>   |
| Transduction, the word and its meaning: one dictionary,<br>different points of view..... | 1          |
| Hormones, evolution, and history .....                                                   | 2          |
| The plasma membrane barrier .....                                                        | 2          |
| Protohormones .....                                                                      | 3          |
| Protoendocrinologists .....                                                              | 5          |
| Hormones: a definition .....                                                             | 10         |
| What's in a name?.....                                                                   | 11         |
| Neurotransmitters .....                                                                  | 12         |
| Ergot.....                                                                               | 14         |
| Receptors and ligands.....                                                               | 16         |
| References .....                                                                         | 17         |
| <b>Chapter 2: First Messengers</b> .....                                                 | <b>21</b>  |
| Hormones .....                                                                           | 25         |
| Growth factors.....                                                                      | 25         |
| Cytokines.....                                                                           | 26         |
| Vasoactive agents.....                                                                   | 26         |
| Neurotransmitters and neuropeptides .....                                                | 27         |
| First messengers with intracellular receptors .....                                      | 27         |
| Common aspects.....                                                                      | 28         |
| Intracellular messengers .....                                                           | 29         |
| Binding of ligands to receptors .....                                                    | 29         |
| Binding heterogeneity .....                                                              | 30         |
| Measurement of binding affinity.....                                                     | 30         |
| $K_D$ and $EC_{50}$ : receptor binding and functional consequences.....                  | 31         |
| Spare receptors .....                                                                    | 32         |
| Down-regulation of receptors .....                                                       | 33         |
| Discovery of the first second messenger, cAMP.....                                       | 34         |
| References .....                                                                         | 35         |

|                                                                       |               |
|-----------------------------------------------------------------------|---------------|
| <b>Chapter 3: Receptors</b>                                           | <b>37</b>     |
| Adrenaline (again)                                                    | 37            |
| $\alpha$ - and $\beta$ -adrenergic receptors                          | 38            |
| Adrenergic receptor agonists and antagonists                          | 38            |
| Acetylcholine receptors                                               | 42            |
| Acetylcholine                                                         | 42            |
| Cholinergic receptor subtypes                                         | 44            |
| Nicotinic receptors                                                   | 44            |
| Muscarinic receptors                                                  | 45            |
| Nicotinic receptors are ion channels                                  | 46            |
| Architecture of the nicotinic receptor                                | 50            |
| Other ligand-gated ion channels                                       | 54            |
| The 7TM superfamily of G-protein-linked receptors                     | 55            |
| Categories of 7TM receptor                                            | 58            |
| Receptor diversity: variation and specialization                      | 59            |
| Binding of low-molecular-mass ligands                                 | 61            |
| Calcium sensors and metabotropic receptors                            | 63            |
| Proteinase-activated receptors (PARs)                                 | 65            |
| The adhesion receptor subfamily                                       | 65            |
| Frizzled                                                              | 66            |
| Receptor–ligand interaction and receptor activation                   | 66            |
| A two-state equilibrium description of receptor activation            | 66            |
| Receptor dimerization                                                 | 69            |
| Transmitting signals into cells                                       | 70            |
| The receptor and the effector: one and the same or separate entities? | 70            |
| Mixing and matching receptors and effectors                           | 71            |
| Intracellular 7TM receptor domains and signal transmission            | 73            |
| Adrenaline (yet again)                                                | 73            |
| References                                                            | 73            |
| <br><b>Chapter 4: GTP-binding Proteins and Signal Transduction</b>    | <br><b>81</b> |
| Nucleotides as metabolic regulators                                   | 81            |
| ATP is not quite what it seems                                        | 82            |
| GTP-binding proteins, G proteins, or GTPases                          | 83            |
| G proteins                                                            | 83            |

|                                                                                             |     |
|---------------------------------------------------------------------------------------------|-----|
| The GTPase cycle: a monostable switch.....                                                  | 84  |
| Switching off activity: switching on GTPase.....                                            | 86  |
| $\alpha$ -Subunits.....                                                                     | 88  |
| $\alpha$ -Subunits determine G protein diversity.....                                       | 89  |
| Sites on $\alpha$ -subunits that interact with the membrane and<br>with other proteins..... | 92  |
| $\beta\gamma$ -Subunits.....                                                                | 94  |
| $\beta$ - and $\gamma$ -subtypes.....                                                       | 94  |
| $\beta\gamma$ -Subunits as signalling proteins.....                                         | 97  |
| The G protein receptor kinase family.....                                                   | 98  |
| Receptor phosphorylation, down-regulation and pathway switching.....                        | 98  |
| Receptor mechanisms obviating G proteins.....                                               | 100 |
| Monomeric GTP-binding proteins.....                                                         | 101 |
| Ras proteins discovered as oncogene products.....                                           | 101 |
| Subfamilies of Ras.....                                                                     | 101 |
| Structure.....                                                                              | 102 |
| Post-translational modifications.....                                                       | 105 |
| GTPases everywhere!.....                                                                    | 106 |
| Mutations of Ras that promote cancer.....                                                   | 106 |
| Functions of Ras.....                                                                       | 107 |
| RasGAPs.....                                                                                | 108 |
| RasGAP.....                                                                                 | 108 |
| Mechanism of GTPase activation.....                                                         | 110 |
| Guanine nucleotide exchange factors (GEFs).....                                             | 111 |
| Essay: Activation of G proteins without subunit unit dissociation.....                      | 111 |
| Pheromone-induced mating response in yeast.....                                             | 113 |
| Monitoring subunit interactions in living cells by FRET.....                                | 114 |
| Constructing the mammalian $\beta$ -adrenergic transduction system in<br>insect cells.....  | 117 |
| References.....                                                                             | 120 |

## Chapter 5: Effector Enzymes Coupled to GTP Binding Proteins:

|                                                   |            |
|---------------------------------------------------|------------|
| <b>Adenylyl Cyclase and Phospholipase C</b> ..... | <b>131</b> |
| Adenylyl cyclase.....                             | 131        |
| Cyclic AMP: the first second messenger.....       | 131        |
| cAMP is formed from ATP.....                      | 133        |

|                                                                              |            |
|------------------------------------------------------------------------------|------------|
| Adenylyl cyclase and its regulation .....                                    | 134        |
| Structural organization of adenylyl cyclases .....                           | 134        |
| Regulation of adenylyl cyclase .....                                         | 136        |
| ADP-ribosylation of $\beta\gamma$ -subunits .....                            | 146        |
| Phospholipase C .....                                                        | 147        |
| First hints of a signalling role for inositol phospholipids .....            | 147        |
| The phospholipase family .....                                               | 147        |
| The isoenzymes of PLC .....                                                  | 148        |
| PLC $\delta$ : a prototype .....                                             | 150        |
| Regulation of PLC .....                                                      | 151        |
| References .....                                                             | 153        |
| <b>Chapter 6: The Regulation of Visual Transduction and Olfaction .....</b>  | <b>159</b> |
| Phototransduction .....                                                      | 159        |
| Sensitivity of photoreceptors .....                                          | 160        |
| Photoreceptor mechanisms .....                                               | 161        |
| Photoreceptor cells .....                                                    | 163        |
| Adaptation: calcium acts as a negative regulator .....                       | 167        |
| Photo-excitation of rhodopsin .....                                          | 170        |

| References .....                                                    | 239 |

## Chapter 9: Phosphorylation and Dephosphorylation:

### Protein kinases A and C..... 243

|                                                                   |     |
|-------------------------------------------------------------------|-----|
| Protein phosphorylation as a switch in cellular functioning ..... | 243 |
| Cyclic AMP and the amplification of signals .....                 | 245 |
| Protein kinase A.....                                             | 246 |
| Protein kinase A and the regulation of transcription.....         | 248 |
| Activation of the CREB transcription factor .....                 | 248 |

|                                                                                    |            |
|------------------------------------------------------------------------------------|------------|
| Attenuation of the cAMP response elements by dephosphorylation                     | 250        |
| Protein kinase A and the activation of ERK                                         | 250        |
| Actions of cAMP not mediated by PKA                                                | 251        |
| Epac, a guanine nucleotide exchange factor directly activated by cAMP              | 251        |
| Protein kinase C                                                                   | 253        |
| Discovery of phosphorylating activity independent cAMP                             | 253        |
| The protein kinase C family                                                        | 254        |
| Structural domains and activation of protein kinase C                              | 255        |
| The C1–C4 regions                                                                  | 255        |
| Activation of protein kinase C                                                     | 259        |
| Multiple sources of diacylglycerol and other lipids activate protein kinase C      | 259        |
| Differential localization of PKC isoforms                                          | 260        |
| Different types of PKC-binding proteins                                            | 261        |
| Holding back the PKC response                                                      | 263        |
| A matter of life or death: PKC signalling complexes in the evasion of the fly-swat | 264        |
| Phorbol ester and inflammation                                                     | 265        |
| References                                                                         | 266        |
| <b>Chapter 10: Nuclear Receptors</b>                                               | <b>273</b> |
| First steps in the isolation of steroid hormones                                   | 273        |
| Origins                                                                            | 273        |
| Beginning again                                                                    | 274        |

| Branching of the signalling pathway.....                                                    | 325 |
| The PLC $\gamma$ -PKC signal transduction pathway.....                                      | 326 |
| The Ras signalling pathway.....                                                             | 327 |
| From Ras to MAP kinase and the activation of transcription.....                             | 334 |
| <i>Raf</i> genes.....                                                                       | 335 |
| Beyond ERK.....                                                                             | 337 |
| Docking sites and a MAP kinase phosphorylation motif.....                                   | 337 |
| Activation of protein kinases by ERKs 1 and 2.....                                          | 337 |
| Activation of early response genes.....                                                     | 342 |
| Regulation of the cell cycle.....                                                           | 343 |
| Fine tuning the Ras-MAP kinase pathway: scaffold proteins.....                              | 344 |
| MAP kinase scaffold proteins discovered in yeast.....                                       | 344 |
| KSR, a mammalian scaffold protein that regulates<br>MAP kinase signalling.....              | 345 |
| Other proteins that regulate MAP kinase pathways.....                                       | 348 |
| Why are the signalling pathways so complicated?.....                                        | 348 |
| Termination of the ERK response.....                                                        | 349 |
| The Ca <sup>2+</sup> -calmodulin pathway.....                                               | 353 |
| Activation of PI3-kinase.....                                                               | 353 |
| Direct phosphorylation of STAT transcription factors.....                                   | 353 |
| A switch in receptor signalling: activation of ERK by 7TM receptors.....                    | 354 |
| Pathway switching mediated by receptor phosphorylation.....                                 | 354 |
| Pathway switching by transactivation.....                                                   | 356 |
| Pathway switching, transactivation, and metastatic progression of<br>colorectal cancer..... | 357 |
| References.....                                                                             | 362 |

### Chapter 13: Signal Transduction to and from

|                                           |            |
|-------------------------------------------|------------|
| <b>Adhesion Molecules.....</b>            | <b>375</b> |
| Adhesion molecules.....                   | 376        |
| Naming names.....                         | 378        |
| Immunoglobulin superfamily.....           | 378        |
| ICAM.....                                 | 379        |
| SIGLEC.....                               | 380        |
| Junctional adhesion molecules (JAMs)..... | 382        |
| Claudins.....                             | 382        |
| Occludin.....                             | 383        |

|                                                                             |     |
|-----------------------------------------------------------------------------|-----|
| Integrins.....                                                              | 383 |
| Inactive to primed.....                                                     | 384 |
| Primed to active.....                                                       | 387 |
| Cadherins.....                                                              | 387 |
| Selectins.....                                                              | 392 |
| Cartilage link proteins.....                                                | 395 |
| Integrins, cell survival, and cell proliferation.....                       | 397 |
| Inside-out signalling and the formation of integrin adhesion complexes..... | 397 |
| Outside-in signalling from integrin adhesion complexes.....                 | 398 |
| Integrins and cell survival.....                                            | 400 |
| Integrins and cell proliferation.....                                       | 403 |
| References.....                                                             | 409 |

#### Chapter 14: Adhesion Molecules in the Regulation of Cell Differentiation: Mainly About Wnt ..... 417

|                                                                                |     |
|--------------------------------------------------------------------------------|-----|
| Destabilization of adherens junctions causes cellular de-differentiation.....  | 417 |
| Signalling through the canonical WNT pathway.....                              | 419 |
| Adenomatous polyposis coli (APC) and the localization of $\beta$ -catenin..... | 424 |
| Take your partner: which way $\beta$ -catenin?.....                            | 426 |
| The ( $\beta$ -catenin-dependent) canonical Wnt pathway.....                   | 426 |
| Wnt organizes the villous epithelium of the small intestine.....               | 434 |
| Mutations of $\beta$ -catenin, Axin, and APC in human cancers.....             | 437 |
| Non-canonical signal transduction pathways.....                                | 438 |
| A role for cadherin in contact inhibition.....                                 | 438 |
| Other examples of signalling through adhesion molecules.....                   | 439 |
| Cadherin in the central nervous system.....                                    | 439 |
| JAM and the regulation of differentiation.....                                 | 439 |
| Occludin interacts with the TGF $\beta$ type I receptor.....                   | 439 |
| Occludin prevents Raf-1-mediated cell transformation.....                      | 440 |
| References.....                                                                | 442 |

#### Chapter 15: Activation of the Innate Immune System: the Toll-like Receptor 4 and Signalling through Ubiquitylation..... 451

|                                     |     |
|-------------------------------------|-----|
| Sensing the microbial universe..... | 452 |
|-------------------------------------|-----|

|                                                                                                   |            |
|---------------------------------------------------------------------------------------------------|------------|
| The toll receptor in <i>Drosophila</i> .....                                                      | 453        |
| Signalling through the TLR4 receptor.....                                                         | 458        |
| The TIRAP/MyD88 pathway.....                                                                      | 460        |
| From TRAF6 to activation of NF- $\kappa$ B.....                                                   | 460        |
| From TRAF6 to activation of IRF-3.....                                                            | 464        |
| The IRF family of transcription factors.....                                                      | 464        |
| Some consequences of TLR4-induced gene transcription.....                                         | 466        |
| Essay: Ubiquitylation and SUMOylation.....                                                        | 467        |
| Ubiquitylation.....                                                                               | 467        |
| Ubiquitylation: a process involving three activities<br>(but not necessarily three proteins)..... | 467        |
| 63K or 48K conjugation.....                                                                       | 468        |
| Two classes of E3-ubiquitin ligases.....                                                          | 469        |
| Ubiquitin-binding proteins.....                                                                   | 470        |
| SUMO and sumoylation.....                                                                         | 470        |
| Essay: The proteasome complex.....                                                                | 471        |
| The proteasome.....                                                                               | 472        |
| 20S particle.....                                                                                 | 472        |
| Proteasome activator (PA) subunits.....                                                           | 474        |
| References.....                                                                                   | 477        |
| <b>Chapter 16: Traffic of White Blood Cells .....</b>                                             | <b>483</b> |
| Inflammation and leukocytes.....                                                                  | 483        |
| Inflammatory mediators.....                                                                       | 483        |
| Tumour necrosis factor- $\alpha$ , potential anti-tumour agent<br>or inflammatory cytokine?.....  | 486        |
| The family of TNF proteins and receptors.....                                                     | 489        |
| TNF- $\alpha$ and regulation of adhesion molecule expression<br>in endothelial cells.....         | 489        |
| Signalling via NF- $\kappa$ B.....                                                                | 493        |
| Chemokines and activation of integrins on leukocytes.....                                         | 494        |
| The three-step process of leukocyte adhesion to endothelial cells.....                            | 501        |
| References.....                                                                                   | 505        |
| <b>Chapter 17: Tyrosine Protein Kinases and Adaptive Immunity :</b>                               |            |
| <b>TCR, BCR, Soluble Tyrosine Kinases and NFAT .....</b>                                          | <b>513</b> |
| The family of non-receptor protein tyrosine kinases.....                                          | 513        |

|                                                                             |     |
|-----------------------------------------------------------------------------|-----|
| T-cell receptor signalling .....                                            | 515 |
| More than one lymphocyte receptor must be engaged to ensure activation..... | 515 |
| PLC $\gamma$ 1 to NFAT .....                                                | 519 |
| The PLC $\gamma$ 1 to NF- $\kappa$ B pathway .....                          | 521 |
| Down-regulation of the TCR response.....                                    | 521 |
| Signalling through interferon receptors .....                               | 523 |
| Interferon- $\alpha$ receptor and STAT proteins .....                       | 525 |
| Alternative signalling pathways.....                                        | 526 |
| Down-regulation of the JAK-STAT pathway.....                                | 527 |
| Oncogenes, malignancy, and signal transduction .....                        | 530 |
| Viral oncogenes.....                                                        | 530 |
| Non-viral oncogenes.....                                                    | 531 |
| Essay: Non-receptor protein tyrosine kinases and their regulation .....     | 532 |
| References .....                                                            | 538 |

## **Chapter 18: Phosphoinositide 3-Kinases, Protein Kinase B, and Signalling through the Insulin Receptor..... 543**

|                                                                                             |     |
|---------------------------------------------------------------------------------------------|-----|
| Insulin receptor signalling; it took a little time to work out the details .....            | 543 |
| Signalling through phosphoinositides .....                                                  | 545 |
| PI 3-kinase, PI(3,4)P <sub>2</sub> and PI(3,4,5)P <sub>3</sub> .....                        | 546 |
| A family of PI 3-kinases.....                                                               | 547 |
| Studying the role of PI 3-kinase .....                                                      | 549 |
| Protein kinase B and activation through PI(3,4,5)P <sub>2</sub> .....                       | 550 |
| Insulin: the role of IRS, PI 3-kinase, and PKB in the regulation of glycogen synthesis..... | 554 |
| From the insulin receptor to PKB.....                                                       | 554 |
| From PKB to glycogen synthase.....                                                          | 557 |
| The role of PI 3-kinase in activation of protein synthesis.....                             | 559 |
| Other processes mediated by the 3-phosphorylated inositol phospholipids .....               | 566 |
| So, who did discover insulin? .....                                                         | 567 |
| References .....                                                                            | 569 |

## **Chapter 19: Protein Kinase C Revisited..... 577**

|                                  |     |
|----------------------------------|-----|
| PKC in cell transformation ..... | 577 |
|----------------------------------|-----|

|                                                                                      |            |
