<i>List of abbreviations</i>	xix
1 Introduction	1
Human influences: implications for conservation	1
Outline of the chapters	3
2 Studying change	9
Defining terms and questioning assumptions	10
Experiments and investigations	11
Darwin's scientific method	11
Advances in the design of experiments	12
Elements of experimental design	12
Quasi-experiments	14
'Proof' and falsification	14
Testing hypotheses about the past	15
Predicting the future	15
Weighing the evidence	16
Concluding remarks	16
3 Key concepts in plant evolution	18
Darwin's ideas about the evolution of species	21
Post-Darwinian contributions to our understanding of evolution	22
Cyto-genetic studies	22
Chemical basis of hereditary information	23
Genetic mutation	25
Chromosome changes	26
Microevolution in plant populations	28
Plants are different from animals	32
Different modes of natural selection	34
r- and K-selection	35
Fitness	36

Neutral theory of selection	36
Post-Darwinian models of speciation	38
Gradual speciation	39
Speciation and founder effects	39
Introgressive hybridisation	40
Sympatric speciation	41
Cytogenetics of polyploidy	41
The success of polyploids	43
Evidence from the fossil record	44
Mass extinctions	44
Punctuated equilibrium	45
Continental drift	46
Orbital variations	46
Conclusions	47
4 The origin and extent of human-influenced ecosystems	50
The origin of humans	50
Human uses of plants	51
Reaching 5 million: hunter-gatherers	52
Reaching 50 million: the beginnings of agriculture	53
The process of domestication of plants	53
Reaching half a billion: the spread of agriculture from 2000 BC to AD 1500	55
The first billion humans: from subsistence to commercial farming 1500–1825	56
Populations rising to 2 billion: the expanding frontiers of agriculture 1825–1927	57
From 2 to over 6.5 billion: the rise of industrial food production 1927 to the present day	58
What is the present extent of human-modified ecosystems?	59
Human geomorphic activities	62
The rise of concern about the environment	62
Conservation through protection	63
The wise use of resources	64
Environmental concerns about pollution	65
Concerns about the loss of biodiversity	71
Confronting the adverse effects of introduced organisms	71
Soil erosion and salination	72
The inexorable rise of human populations	73
Demographic projections for the next 40–50 years	74
Ecological footprints	74
Conclusions	76

5	Consequences of human influences on the biosphere	77
	Cultural landscapes	77
	Is there any wilderness left?	80
	Wilderness concepts	81
	Wilderness and the 'Pristine Myth'	81
	Megafaunal extinctions	82
	Cultural landscapes and fire	82
	How 'virgin' is virgin rainforest?	83
	Wild areas in Europe	84
	The myth of oceans as wilderness	86
	The myth and its implications	86
	The first conservationists	86
	Man and nature	87
	Human activities as viewed by environmentalists	88
	Human activities: the concept of niche construction	88
	Ecosystems: natural and human influenced	91
	Conclusions	95
6	Categories	97
	Species	97
	Early ideas about species	97
	Species concepts	98
	Numbers of species in different categories	100
	Conservation uses of the term 'species'	100
	How many plant species are there in the world?	101
	Native and introduced species	104
	Lines of evidence concerning status	104
	Assessing the evidence: criteria for native and introduced status	110
	Wildlife	113
	Wild and cultivated plants	114
	Feral plants	115
	Weeds	116
	Invasive plants	117
	Endangered species	118
	The taxonomic community becomes aware of the possibility of large-scale extinctions	121
	The current extinction rate and prospects for the future	121
	The time frame of the extinction process	123
	Assessing the threat of extinction	123
	Assessing the risk of species extinction under climate change	124
	Threats to cultivated plants and forest trees	124
	Conclusions	125

7	Investigating microevolution in plants in anthropogenic ecosystems	127
	Natural selection	127
	Studies of wild populations: some early experiments	128
	How might natural selection in human-influenced ecosystems be studied?	129
	Methods of detecting natural selection used in plant studies	129
	Important techniques for studying selection	130
	The use of molecular markers in microevolutionary studies	131
	Assessment of microevolutionary studies	137
	The relationship of microevolution to conservation	139
	Conserving species: typological approaches	140
	Changing goals: preservation vs. conservation of evolutionary potential	140
	Conclusions	141
8	Plant microevolution in managed grassland ecosystems	142
	Herbivory in anthropogenic ecosystems	142
	The antiquity of grassland management for pasture and hay	144
	Early studies of grazing and hay ecotypes in garden trials	147
	The finding of unplanned dateable 'experiments'	147
	Artificial selection experiments	147
	Experimental investigations of selection	148
	Seasonal ecotypes	148
	Comparative studies of pasture and hay ecotypes	151
	Park Grass Experiment: <i>Anthoxanthum odoratum</i>	154
	Selection in lawns and golf courses	157
	Temperature-controlled germination	158
	Disruptive selection in <i>Poa annua</i>	159
	Comparative studies of lawns and other grassland types	161
	Gene flow in grasslands by movement of hay	164
	Seed banks	165
	Gene flow by dispersal of seeds in animal husbandry	165
	Concluding remarks	166
9	Harvesting crops: arable and forestry	168
	Arable weedy populations: general purpose genotypes or specialist races?	169
	Crop mimicry	170
	Life-history variation	175
	Growth strategies in relation to land use	175
	Speed of development in relation to weeding pressures	176
	Vernalisation and winter and summer annual habit	178
	Timing of maturity in relation to crop harvest	179
	Dormancy	179

Seed production and soil seed banks	180
Herbicide resistance	181
Incidence of herbicide resistance	182
Speed with which resistance develops	184
Fitness: costs and benefits	186
Withdrawal of herbicide treatment	188
Effects of herbicide treatments: winners and losers	189
How have weed populations changed under herbicide treatments?	189
Selection pressures associated with the development of modern agricultural practices	190
Differential responses to farming practices	191
Winners and losers in forested areas	191
Coda	197
10 Pollution and microevolutionary change	200
Reductionist approaches in the study of the effects of pollution	201
Effects of sulphur dioxide pollution	202
Ozone pollution	204
The evolution of ozone resistance	207
Resistance to heavy metals	209
Naturally occurring areas with high heavy metal content	210
Sources of anthropogenic heavy metal pollution	210
Heavy metals in soils	211
Definitions	212
Testing for metal tolerance	212
Genetics of tolerance	214
Origin of tolerant variants	214
Restrains on the evolution of tolerance	216
Gene flow and selection	217
Speed of development of heavy metal tolerance: lines of evidence	219
Conclusions	223
11 Introduced plants	225
The 'introduction process'	227
Establishment: founder effects, genetic drift and multiple introductions	230
Plant introductions: winners and losers	239
Some species are successfully introduced but many fail to establish	239
Establishment of introduced species: the importance of mutualisms	241
Development of introduced populations: the lag phase	242
Allee effects	243
Dispersal vectors and the availability of new habitat	244
Lag phase: causes unknown	245
Natural selection in naturalising populations of plants	246

General-purpose genotypes	248
Evolutionary changes in animal populations linked to introduced plants	249
Natural selection: which species are likely to succeed as invaders?	250
The successes of invasive plants: interrelationships with other species	251
Ecological consequences of introductions	255
Coda	258
12 Endangered species: investigating the extinction process at the population level	261
A general model of declining populations	262
Habitat loss and ecosystem changes	263
The vortex model and cultural landscapes	263
The nature of fragmented populations	264
Populations declining to extinction	264
Studying populations of plants	266
Pollen limitation in plant populations	270
Allee effects in plants: dioecy and gynodioecy	272
Allee effects in plants: self-incompatibility	272
Climatic limitations on reproduction	275
The extinction vortex: stochastic events	275
The vortex model: genetic effects	277
The genetics of small and fragmented populations	279
How large do populations have to be to ensure long-term survival?	283
PVA predictions and conservation	285
Metapopulations	286
Concluding comments	288
13 Hybridisation and speciation in anthropogenically influenced ecosystems	290
Will new species quickly evolve to take the place of those that become extinct?	290
The evolution of a new polyploidy in <i>Spartina</i>	291
The origin of <i>Senecio cambrensis</i>	293
Evolution of new <i>Tragopogon</i> species	294
Evolution of new homoploid species through hybridisation	295
The rarity of recent polyploidy in wild plants	295
What happens when human activities cause a breakdown of reproductive isolation?	296
Hybridisation: the extent of gene flow	297
Hybridisation and introgression: the use of molecular markers to test hypotheses	297
Breakdown of ecological isolation in <i>Iris</i> : species interactions	298
Introgression in <i>Rorippa</i> in Germany	303

Introgression between introduced species: is hybridisation a stimulus to invasiveness?	303
How might hybridisation stimulate invasiveness?	304
Invasiveness following interspecific hybridisation between introduced fungi	305
Invasiveness following intraspecific hybridisation	305
Crop-wild-weed interactions	306
Microevolution in action through hybridisation in weeds	307
New weedy species arise through crop-weed-wild interactions	307
Hybridisation increases the extinction risk in endangered species	307
Transgenic crops and their interactions with wild and weedy relatives	308
The microevolution of weed beets	310
Transgenic beet	312
Keeping the transgene within the crop	314
Crop-weed-wild hybrids: estimates of their fitness	315
Hybridisation and conservation	315
Extinction of endangered species through hybridisation and introgression	316
Conservation of hybridising species	318
Concluding remarks	319
14 Ex situ conservation	323
Botanic gardens	323
History of botanic gardens	324
Traditional botanic gardens: what do they contain?	325
Botanic gardens: Victorian relics or twenty-first century challenge?	326
Gardeners and conservation	327
Ex situ conservation in botanic gardens	328
Some inherent limitations of botanic gardens	330
Ex situ conservation: seed banks of wild species	333
Micropropagation	335
Other types of gene bank	336
Genetic changes in cultivation and in seed banks	337
Ex situ conservation of whole ecosystems	343
Selection in gardens can also change the breeding behaviour of a species	344
How far has ex situ conservation of plants in botanic gardens succeeded?	345
Botanic gardens and the conservation message	348
Future prospects for ex situ conservation in botanic gardens	349
Will ex situ conservation lead to domestication?	350
Conclusions	352

15	<i>In situ</i> conservation: within and outside reserves	354
	A call for parks to preserve forests	354
	Early parks and 'reservations'	354
	Protection of forests and preservation of sites of scenic beauty	356
	The establishment of American National Parks	357
	The aims of the national parks	358
	The concept of human exclusion	358
	Changing aims	359
	The establishment of parks and reserves in Europe	362
	Managing reserves in cultural landscapes: Wicken Fen as a case study	364
	Conservation management: a Darwinian perspective	365
	Examples of 'resort to precedent' in the management of individual species	367
	Reintroducing traditional management	367
	Ecosystem management in the past	368
	Restoration of traditional practices	369
	The devising of non-traditional practices by conservation managers	370
	The role of experiments in conservation management	370
	A call for evidence-based conservation	373
	Conflicts in conservation management	375
	Is resort to precedent sufficient to ensure the survival of endangered species and ecosystems in cultural landscapes?	376
	National parks and reserves: threats from illegal activities	380
	Conclusions	382
16	Creative conservation through restoration and reintroduction	384
	Creative conservation through restoration projects: some examples	386
	Which stocks of plants should be used in creative conservation?	386
	Creative conservation of endangered species	395
	Complex ecosystems: understanding succession	401
	Aims and objectives in restorations for conservation: differing views	403
	Changes in management style: implications for microevolution	405
	Restoration and management: gardening the wild	406
	Concluding remarks	408
17	Reserves in the landscape	412
	Reserve design	412
	The application of the theory of island biogeography to conservation	413
	Fragmentation	416
	Impact of fragmentation	417
	The matrix surrounding reserves	418
	Edge effects	419
	The proximity of reserves to migration corridors	421
	Corridors in the landscape	422

Evidence for functioning corridors	423
Strengths and weaknesses of corridors as linkages between reserves	425
Reserves and the conservation of particular species	425
The location of present-day reserves in relation to biodiversity 'hotspots'	427
Aquatic freshwater ecosystems in parks, reserves and matrix	428
Marine reserves	429
Concluding comments	429
18 Climate change	434
The greenhouse effect and climate change	434
Direct observations of climate change	436
Long-term changes in climate	437
The likelihood that humans are contributing to climate change	437
Projections of climate change in the future	437
Assessment of climate change in the future	437
Concluding remarks	440
19 Microevolution and climate change	443
Responses to increased carbon dioxide in the air, rising temperatures and drought	443
Recent changes in the timing of various life cycle events	448
Phenology: different environmental cues provide the triggers for key processes	449
Range shifts: vegetation zones and individual species	449
Plant responses to previous climate change	454
Adaptation and migration of species: is there a significant role for selection?	455
Microevolutionary responses to climate change	457
Interactions amongst species and the effects of climate change	459
Migration in the face of climate change: microevolutionary speculations	460
Concluding remarks	464
20 The implications of climate change for the theory and practice of conservation	466
Doubts about modelling	466
National parks and nature reserves as the major focus of conservation efforts	468
Climate change in areas of high conservation significance	468
The mandates of national parks	471
Management and restoration in reserves and the wider environment	472
Choice of stocks to use in restoration and management	472
The withdrawal of management and restoration	473
The conservation of endangered species	473

Relocation of reserves	474
Wildlife corridors	474
Stepping stone areas to encourage migration	476
Assisted migration	479
Climate change: our response to the warning signs	481
Human adaptation: the threats this poses to areas of conservation interest	483
Conclusions	484
21 Overview	487
Microevolution and conservation: Darwin's insights	487
Cultural landscapes	487
Conservation strategies	488
<i>In situ</i> conservation: protected fortresses	489
Sustainable development	489
Human activities impose selective forces	491
Human activities and domestication	493
Maintaining species in a 'wild' state in managed environments	494
From the domesticated to the feral	495
Co-evolution of humans, domesticated cattle and plants	497
Kulturfolger	498
Will humankind make the necessary adaptation to bring climate change under control?	500
References	505
Index	584
