

Contents

1. Basic probability models for data.....	3
The R prompt.....	3
A data set.....	3
Indexing arrays.....	4
Writing and using functions.....	5
Data summaries.....	6
Empirical and binned distributions.....	10
Empirical moments.....	11
Continuous parametric moments.....	12
Samples from the population.....	13
Some parametric probability models for the data.....	16
A frequency distribution of estimates.....	21
Exercises:.....	22
2. Maximum likelihood estimates.....	27
Maximum likelihood.....	27
Confidence intervals.....	28
Likelihood profile.....	28
Fisher Information.....	30
Nonparametric bootstrap.....	30
A Bayesian example.....	33
Count data and multiple parameters.....	34
Moment matching.....	37
Product moment estimates of survivorship (optional).....	38
A linear regression example.....	40
Exercises.....	44
3. Case study on maximum likelihood: fire risk increase with time.....	46
Models based on the binomial and Poisson.....	46
The optimum of a likelihood surface.....	49
A likelihood ratio test.....	51
The likelihood surface.....	52
A likelihood profile.....	52
Exercises:.....	55
Research project 1: Getting started.....	56
A project prospectus.....	56
4. Case study on classical inference: cone production in pines.....	57
A basic model.....	57
A classical approach.....	57
Combining state change, size, and CO ₂	61
Exercises.....	66
Research project 2: Problem setup and data simulation.....	69
Next steps.....	69
Example.....	69
Step 1: Directed graph.....	69
Step 2: Equations.....	70
Step 3. Simulate data.....	71

Your research problem.....	75
Lab 5. Simulating a posterior distribution	76
Rejection sampling	76
Truncated normal distribution	79
Regression with Gibbs sampling	79
A nonlinear model	84
Generalized linear regression	87
GLM with extra-Poisson variation	89
Autoregression.....	92
Bayesian kriging with a GLM	96
Exercises	102
Lab 6. Some time series applications	103
Population dynamics.....	103
A Bayesian state space model	107
Exercise	112
Research project 3: Constructing a Gibbs sampler for simulated data.....	114
Answers to selected lab exercises.....	120
Lab 1	120
Lab 2	125
Lab 3	129
Lab 4	131
Lab 5	133
Lab 6	133
Density dependence and population growth: evaluating classical and Bayesian approaches to parameter estimation and model selection.....	134
Introduction	134
Results and Discussion	135
Parameter estimates	135
Model selection.....	140
Informative Priors	141
Conclusions	142
