Acknowledgment	v
Foreword	xi
Abbreviations	xiii
1 Introduction	1
1.1 Terminology	2
1.2 Design and development of microarrays	3
2 Applications	7
2.1 Scientific problems	7
2.2 The pharmaceutical goal	10
2.3 The demands of biotechnical companies	12
3 Technology	15
3.1 Protein microarrays	15
3.1.1 Gene and protein expression	15
3.1.2 Protein sundries: from molecule to biochip	24
3.1.3 Protein chips	42
3.2 Nucleic acid microarrays	57
3.2.1 Hybridization probes	57
3.2.2 Minimal quantities of RNA; What to do?	63
3.2.3 Production of DNA microarrays	70
3.3 Microarray detection	76
3.3.1 Light and radiation	76
3.3.2 Luminescent fluorophore T	78
3.3.3 High-energy laser light	84
3.3.4 Microarray scanner: Mode of operation	86
3.3.5 Operating mode of microarray imagers	90
3.3.6 Dynamic range	92
3.3.7 Pixels and spots	93
3.4 Microarray marking systems	94
3.4.1 Tyramide-signal amplification	94
3.4.2 Dendrimers....	95
3.4.3 Quantum dots	96
3.4.4 Chemiluminescence	99
3.4.5 Radioactivity	100
3.4.6 Time-resolved fluorescence	100
4 Instrumentation and Software	105
4.1 Microarray spotters	106

4.1.1	Mechanical contact spotting	110
4.1.2	Piezo-dispenser technology	111
4.1.3	Grids and spots	115
4.2	Digitizing: The microarray scanner	115
4.2.1	The microarray imager	116
4.2.2	The microarray scanner	117
4.3	Microarray software and documentation	117
4.3.1	Documentation of microarray experiments	119
4.3.2	Design of the experiment	120
4.3.3	Validation of the results	121
4.3.4	Microarray software	123
4.3.5	Comparison of expression data	129
4.3.6	Advanced analysis	131
4.4	Additional laboratory equipment and Laboratory requirements for microarray applications	136
4.4.1	Supplies	136
4.4.2	Additional helpful laboratory equipment	136
4.5	Clean-room technology	137
4.5.1	Cleanliness classes	137
4.5.2	Clean-room systems	138
5	Execution of the Microarray Experiment	141
5.1	Isolation and preparation of nucleic acids	141
5.1.1	Isolation of RNA	141
5.1.2	mRNA isolation from eukaryotes	142
5.1.3	mRNA isolation from bacteria	142
5.1.4	Specimen fabrication with the aid of cDNA synthesis	143
5.1.5	Hybridization on the DNA biochip	144
5.1.6	Preamplification with T7-RNA polymerase	144
5.1.7	Fabrication of the microarray samples	146
5.1.8	Quantification, inspection, reliability	147
5.1.9	Hybridization of the samples	147
5.1.10	Poly (L-lysine) coating	149
5.2	Protein array protocols	149
5.2.1	Protein array buffers	150
5.2.2	Verification with antibodies	152
5.2.3	Protein kinase array: Verification with ³³ P	153
6	High-Throughput Screening	155
6.1	Laboratory automation	156
6.1.1	Laboratory automation software	158
6.1.2	Preparation of samples	160
6.1.3	Analysis and reporting	160

6.2	Drug-target screening	164
6.3	Clinical chemistry and genetic screening	164
7	Database Research and Patents	169
7.1	Database research	169
7.2	Patents	170
7.2.1	Patent research	171
7.2.2	Patent-protected technologies	177
7.3	Brands and trademarks	183
8	Prospects for the Future	185
8.1	Technical developments	185
8.2	Requirement profiles	186
8.3	The end of the end	189
9	Appendix	191
9.1	Common buffers	191
9.1.1	Spotting- and washing buffers	191
9.1.2	Block solutions	191
9.1.3	Hybridization solutions	192
9.2	Formula for the calculation of the annealing temperature of oligonucleotides	192
9.2.1	Formula for oligonucleotides up to 15 bases	192
9.2.2	Formula for oligonucleotides from 20 to 70 bases	192
9.3	Molar specifications and calculations	192
9.3.1	Definition of a mole	192
9.3.2	Definition of molar mass and molarity	192
9.3.3	Picomolar quantities for nucleic acids	193
9.3.4	Definition of the dalton unit	193
9.3.5	Picomolar quantities for proteins and peptides	194
9.4	Calculation of the microarray spot surface area	194
9.5	Calculation of the microarray spot density	195
9.5.1	Spot density based on center-to-center distance	195
9.5.2	Spot density based on the number of absolute spots per cm ²	195
9.6	Calculation of fluorophore or target density	195
	Company Register	197
	Web Links	201
	Index	203
