Preface	xiii		
Chapter 1 Tools of the Cell Biologist	1		
Microscopy: One of the Earliest Tools of the Cell Biologist	5		
Fluorescence Microscopy	7		
Immunolabeling	9		
Genetic Tagging	14		
Electron Microscopy	15		
Transmission Electron Microscopy	15		
Scanning Electron Microscopy	18		
Atomic-Force Microscopy	18		
More Tools of Cell Biology	19		
Cell Culture	19		
Flow Cytometry	22		
Subcellular Fractionation	23		
The Techniques of Proteomics and Genomics Are Discussed in Later Chapters	25		
Summary	25		
Chapter 2 Cell Membranes	27		
Membrane Lipids	29		
The Lipid Composition of Human and Animal Biological Membranes Includes Phospholipids, Cholesterol, and Glycolipids	29		
Membrane Lipids Undergo Continuous Turnover	30		
Membrane Lipids Are Constantly in Motion	33		
Membrane Protein-Lipid Interactions Are Important Mediators of Function	36		
Integral and Peripheral Membrane Proteins Differ in Structure and Function	36		
Membrane Protein Organization	38		
Optical Technologies Such as Microscopy and Flow Cytometry Have Revolutionized the Study of Membranes	38		
Important Changes in Membrane Phospholipids Occur in Sickle Cell Disease	41		
The Cell Membrane Is a Selective Permeability Barrier That Maintains Distinct Internal and External Cellular Environments	43		
Water Movement across Membranes Is Based on Osmosis	44		
Donnan Effect and Its Relation to Water Flow	46		
Facilitated Transport	47		
Active Transport	48		
Secondary Active Transport	48		
Ion Channels and Membrane Potentials	49		
The Membrane Potential Is Caused by a Difference in Electric Charge on the Two Sides of the Plasma Membrane	52		
Action Potentials Are Propagated at the Axon Hillock	54		
Summary	56		
Chapter 3 Cytoskeleton	59		
Microfilaments	59		
Actin-Based Cytoskeletal Structures Were First Described in Muscle Tissue	59		
Skeletal Muscle Is Formed from Bundles of Muscle Fibers	60		
The Functional Unit of Skeletal Muscle Is the Sarcomere	60		
Thin Filaments Are Built from the Proteins Actin, Tropomyosin, Troponin, and Tropomodulin	60		
Thick Filaments Are Composed of the Protein Myosin	64		
Accessory Proteins Are Responsible for Maintenance of Myofibril Architecture	64		
Muscle Contraction Involves the Sliding of the Thick and Thin Filaments Relative to Each Other in the Sarcomere	66		
Adenosine Triphosphate Hydrolysis Is Necessary for Cross-Bridge Interactions with Thin Filaments	67		
Calcium Regulation of Skeletal Muscle Contraction Is Mediated by Troponin and Tropomyosin	68		
Intracellular Calcium in Skeletal Muscle Is Regulated by a Specialized Membrane Compartment, the Sarcoplasmic Reticulum	69		
Three Types of Muscle Tissue Exist	70		
The Contractile Apparatus of Smooth Muscle Contains Actin and Myosin	73		

Smooth-Muscle Contraction Occurs via Myosin-Based Calcium Ion Regulatory Mechanisms	74	Microtubules and Motor Proteins Are Responsible for the Function of the Mitotic Spindle	98
Smooth-Muscle Contraction Is Influenced at Multiple Levels	75	Summary	100
Actin-Myosin Contractile Structures Are Found in Nonmuscle Cells	75	Chapter 4 Organelle Structure and Function	101
Members of the Myosin Supergene Family Are Responsible for Movement of Vesicles and Other Cargo Along Actin Tracks in the Cytoplasm	77	The Nucleus	103
Bundles of F-Actin Form a Structural Support for the Microvilli of Epithelial Cells	78	Endoplasmic Reticulum	104
The Gel-Sol State of the Cortical Cytoplasm Is Controlled by the Dynamic Status of Actin	78	Smooth Endoplasmic Reticulum	104
Cell Motility Requires Coordinated Changes in Actin Dynamics	79	Rough Endoplasmic Reticulum	107
Inhibitors of Actin-Based Function	81	Leaving the Endoplasmic Reticulum: A Paradigm for Vesicular Traffic	118
Actin-Binding Proteins	81	Overview of Vesicle Budding, Targeting, and Fusion	118
The ERM Family Mediates End-on Association of Actin with the Cytoplasmic Surface of the Plasma Membrane	81	Endoplasmic Reticulum to Golgi Vesicle Transport and COPII-Coated Vesicles	121
Spectrin Membrane Skeleton	82	The Golgi Apparatus	121
The Structure and Function of the Erythrocyte Spectrin Membrane Skeleton Are Understood in Exquisite Detail	82	Glycosylation and Covalent Modification of Proteins in the Golgi Apparatus	122
Spectrin Is a Ubiquitous Component of Nonerythroid Cells	85	Retrograde Transport through the Golgi Complex	123
Spectrins I and II, α -Actinin, and Dystrophin Form the Spectrin Supergene Family	86	Anterograde Transport through the Golgi Complex	125
Regulation of Actin Dynamics	88	Leaving the Golgi Complex	125
Intermediate Filaments	89	Constitutive and Regulated Secretion	125
A Heterogeneous Group of Proteins Form Intermediate Filaments in Various Cells	89	Lysosomal Enzymes Are Targeted via a Mannose 6-Phosphate Signal	126
How Can Such a Heterogeneous Group of Proteins All Form Intermediate Filaments?	90	Endocytosis, Endosomes, and Lysosomes	128
Microtubules	91	Clathrin-Dependent Endocytosis	128
Microtubules Are Polymers Composed of Tubulin	91	Receptor-Mediated Endocytosis of Low-Density Lipoprotein and Transferrin	129
Microtubules Undergo Rapid Assembly and Disassembly	91	Multivesicular Endosomes	131
By Capping the Minus Ends of Microtubules, the Centrosome Acts as a Microtubule-Organizing Center	92	Lysosomes	132
The Behavior of Cytoplasmic Microtubules Can Be Regulated	94	The Ubiquitin-Proteasome System Is Responsible for Nonlysosomal Protein Degradation	132
Microtubules Are Involved in Intracellular Vesicle and Organelle Transport	95	Mitochondria	134
Cilia and Flagella Are Specialized Organelles Composed of Microtubules	95	ATP Production by Oxidative Phosphorylation	134
Axonemal Microtubules Are Stable	97	Mitochondrial Genetic System	140
Microtubule Sliding Results in Axonemal Motility	97	Defects in Mitochondrial Function Can Cause Disease	140
		Mitochondria Import Most of Their Proteins from the Cytosol	143
		Peroxisomes	145
		Summary	147
		Chapter 5 Regulation of Gene Expression	149
		Cell Nucleus	149
		Nucleus Structure	149
		Nuclear Function	155
		DNA Replication and Repair Are Critical Nuclear Functions	156
		Replication of DNA Occurs during the Synthetic (S) Phase of the Cell Cycle	156
		DNA Repair Is a Critical Process of Cell Survival	159

Regulation of Gene Expression	165	Platelets Adhere to Form Blood Clots	210
Genomics and Proteomics	165	Embryonic Development Involves Many Adhesion-Dependent Events	212
Restriction Nucleases: Enzymes That Cleave DNA at Specific Nucleotide Sequences	165	Cell Adhesion Receptors Transmit Signals That Regulate Cell Behavior	213
Gene Cloning Can Produce Large Quantities of Any DNA Sequence	167	Cell Growth and Cell Survival Are Adhesion Dependent	214
The Primary Structure of a Gene Can Be Rapidly Determined by DNA Sequencing	167	Cell Adhesion Regulates Cell Differentiation	215
Specific Regions of the Genome Can Be Amplified with the Polymerase Chain Reaction	168	Extracellular Matrix	215
Bioinformatics: Genomics and Proteomics Offer Potential for Personalized Medicine	170	Collagen Is the Most Abundant Protein in the Extracellular Matrix	216
Transgenic Mice Offer Unique Models of Genetic Diseases	172	Glycosaminoglycans and Proteoglycans Absorb Water and Resist Compression	218
Gene Expression: The Transfer of Information from DNA to Protein	174	Elastin and Fibrillin Provide Tissue Elasticity	220
Genetic Therapy	189	Fibronectin Is Important for Cell Adhesion	220
There Are Many Obstacles to the Development of Effective Gene Therapies	189	Laminin Is a Key Component of Basement Membranes	220
Many Strategies Are Available for Gene-Based Therapies	189	Basement Membranes Are Thin Matrix Layers Specialized for Cell Attachment	221
Summary	190	Fibrin Forms the Matrix of Blood Clots and Assembles Rapidly When Needed	222
Chapter 6 Cell Adhesion and the Extracellular Matrix	191	von Willebrand Factor in Normal and Abnormal Blood Clotting	223
Cell Adhesion	192	Summary	224
Most Cell Adhesion Molecules Belong to One of Four Gene Families	192	Chapter 7 Intercellular Signaling	227
Cadherins Are Calcium-Dependent Cell-Cell Adhesion Molecules	192	General Modes of Intercellular Signaling	227
The Immunoglobulin Family Contains Many Important Cell Adhesion Molecules	193	Intercellular Signaling Molecules Act as Ligands	227
Selectins Are Carbohydrate-Binding Adhesion Receptors	194	Cells Exhibit Differential Responses to Signaling Molecules	227
Integrins Are Dimeric Receptors for Cell-Cell and Cell-Matrix Adhesion	195	Intercellular Signaling Molecules Act via Multiple Mechanisms	228
Intercellular Junctions	195	Hormones	228
Tight Junctions Regulate Paracellular Permeability and Cell Polarity	196	Lipophilic Hormones Activate Cytosolic Receptors	228
Adherens Junctions Are Important for Cell-Cell Adhesion	198	Receptors for Lipophilic Hormones Are Members of the Nuclear Receptor Superfamily	231
Desmosomes Maintain Tissue Integrity	200	Peptide Hormones Activate Membrane-Bound Receptors	231
Gap Junctions Are Channels for Cell-Cell Communication	203	The Hypothalamic-Pituitary Axis	233
Hemidesmosomes Maintain Cell-Matrix Adhesion	203	Growth Factors	234
Focal Contacts Are Adhesions Formed with the Substratum by Cultured Cells	206	Nerve Growth Factor	235
Cell Adhesion Has Many Important Roles in Tissue Function	207	Growth Factor Families	235
Junctions Maintain Epithelial Barrier Function and Polarity	207	Growth Factor Synthesis and Release	236
Leukocytes Must Adhere and Migrate to Combat Infection and Injury	209	Growth Factor Receptors Are Enzyme-Linked Receptors	236
		Growth Factors Are Paracrine and Autocrine Signalers	236
		Some Growth Factors Can Act over Long Distances	237
		Some Growth Factors Interact with Extracellular Matrix Components	237
		Histamine	237
		Histamine Receptor Subtypes	238

Mast Cell Histamine Release and the Allergic Reaction	238	Mitosis	278
Gases: Nitric Oxide and Carbon Monoxide	238	What Is Mitosis?	278
Eicosanoids	239	Interphase and Mitosis	278
Neurotransmitters	241	Mitotic Stages	278
Electrical and Chemical Synapses	241	Cell-Cycle Checkpoints	279
A Prototypical Chemical Synapse: The Neuromuscular Junction	243	Molecular Components of the DNA Damage Checkpoints	280
Characteristics, Synthesis, and Metabolism of Neurotransmitters	245	Meiosis	280
Neurotransmitter Receptors	246	Sensors Recognize Sites of DNA Damage	282
Divergence and Convergence of Neurotransmitter Function	246	ATM and ATR	282
Spatiotemporal Summation	246	Mediators Simultaneously Associate with Sensors and Signal Transducers	283
Summary	247	Signal Transducers CHEK1 and CHEK2 Are Kinases Involved in Cell-Cycle Regulation	284
Chapter 8 Cell Signaling Events	249	Effectors p53 and Cdc25 Phosphatases Are Important Effector Proteins in Cell-Cycle Regulation	284
Signaling Is Often Mediated by Cell-Surface Receptors	249	G1/S Checkpoint	285
Receptor Tyrosine Kinases and RAS-Dependent Signal Transduction	250	Intra-S-Phase Checkpoint	285
Fibroblast Growth Factors	250	G2/M Checkpoints	286
Neuregulin	250	Cell-Cycle Alterations and Cancer	286
Signaling by Catalytic Receptors/Serine-Threonine Kinases	253	Perturbations in Regulating the G1-to-S Transition in Cancer	286
Bone Morphogenetic Proteins	254	pRb Pathway in Cancer	287
Nodal	255	ATM in Cancer	287
Signaling by Nonkinase Receptors	256	p53 in Cancer	288
Wnts	257	The Checkpoint Kinases and Cancer	288
Hedgehogs	257	CHEK1 and Cancer	288
Notch	260	CHEK2 and Cancer	289
Signaling by Steroid Hormone Receptors Requires Ligand Interaction within the Cytoplasm or Nucleus	262	Summary	289
Signaling by G-Protein-Coupled Receptors Involves Cleavage of Guanosine Triphosphate to Guanosine Diphosphate	265	Chapter 10 Programmed Cell Death	291
Signaling by the Renin-Angiotensin-Aldosterone System	266	Distinct Forms of Programmed Cell Death	292
Signaling by the Jak/STAT Pathway	267	Naturally Occurring Neuronal Death Is Regulated by Factors Provided by Other Cells	292
Calcium/Calmodulin Signal Transduction	267	Neurotrophin Receptors	295
Signaling by the Calcineurin/NFAT pathway	268	Apoptosis Is Regulated by a Cell-Intrinsic Genetic Program	296
Signaling by Ion Channel Receptors	268	Caspases	296
Signaling in Myocardial Hypertrophy	270	Caspase Inhibition	299
Summary	270	Bcl-2 Proteins	300
Chapter 9 The Cell Cycle and Cancer	273	Engulfment of the Apoptotic Cell	302
Cell Cycle: History	273	Signaling Pathways That Promote Cell Survival	302
The Cell Cycle Is Regulated by Cyclin and Related Proteins	275	Phosphatidylinositol 3-Kinase/Akt Signaling Pathway	302
Cyclins	275	Raf/MEK/ERK Signaling Pathway	303
Cyclin-Dependent Kinases	275	Apoptosis and Human Disease	305
Cyclin-Dependent Kinase Inhibitors	276	Summary	306
Cdc25 Phosphatases	276	Index	309
p53	276		
pRb	276
