|------------------------------------------------------------------------------------------|-------------|
| <b>Preface</b>                                                                           | <b>xiii</b> |
| <b>Introduction: Basics of Bio/Ecosystems and Biochemistry, and Other Basic Concepts</b> | <b>1</b>    |
| Biosphere (Ecosystem)                                                                    | 1           |
| Components of the Biosphere—Living Organisms                                             | 1           |
| Bodily Structures of Living Organisms                                                    | 3           |
| Cells, the Basic Functional Units of Living Organisms                                    | 3           |
| Biochemical Compounds Essential to Life                                                  | 4           |
| Carbohydrates                                                                            | 5           |
| Monosaccharides                                                                          | 5           |
| Polysaccharides and Derivatives                                                          | 7           |
| Lipids                                                                                   | 8           |
| Fats and Phospholipids                                                                   | 9           |
| Steroids                                                                                 | 10          |
| Proteins and Amino Acids                                                                 | 10          |
| Structures                                                                               | 10          |
| Reactions—Formation and Hydrolysis of Protein                                            | 16          |
| Vitamins (Coenzymes), Nucleotides, and Others                                            | 17          |
| Coenzymes                                                                                | 17          |
| Nucleotides                                                                              | 18          |
| Other Vitamins                                                                           | 19          |
| DNA/RNA (Polynucleotide)                                                                 | 19          |
| Structures                                                                               | 19          |
| Reactions                                                                                | 23          |
| Types of Biochemical Reactions                                                           | 24          |
| Reactions of Acid-Base Type                                                              | 24          |
| Reactions of Oxidation-Reduction Type                                                    | 25          |
| The Idea of Oxidation State                                                              | 26          |
| The Oxidation State of C in Organic Compounds and Recognition of                         |             |
| Oxidation-Reduction Reactions                                                            | 26          |
| Other Kinds of Oxidation-Reduction Reactions                                             | 29          |
| Free Radical Reactions                                                                   | 30          |
| Transition State Theory of Reaction, and Enzyme Kinetics                                 | 30          |
| Energy Profile and Transition State Theory of Reaction                                   | 31          |
| Enzyme Kinetics                                                                          | 32          |
| Enzyme Reaction Mechanism                                                                | 33          |
| <b>CHAPTER 1 The Distribution of Elements</b>                                            | <b>37</b>   |
| 1.1. The Distribution of Elements in the Earth's Crust, Seawater, and Organisms          | 37          |
| 1.2. The Engines That Drive the Biochemical Cycling of the Elements                      | 41          |

|                  |                                                                                    |           |
|------------------|------------------------------------------------------------------------------------|-----------|
| 1.3.             | Flow of the Elements—Biogeochemical Cycling                                        | 42        |
| 1.4.             | Historical Change in the Biogeochemical Cycling of Elements                        | 45        |
| <b>CHAPTER 2</b> | <b>Biological Needs for and the Behaviors of Inorganic Elements</b>                | <b>53</b> |
| 2.1.             | Introduction                                                                       | 53        |
| 2.2.             | Inorganic Elements in the Biological Systems                                       | 54        |
| 2.2.1.           | Inorganic Elements Involved at the Molecular Level                                 | 54        |
| 2.2.2.           | Inorganic Elements Involved at the Cellular Level                                  | 55        |
| 2.2.3.           | Inorganic Elements Involved at the Physiological Level                             | 55        |
| 2.2.4.           | Biological Systems Involved in the Metabolism of Inorganic Elements                | 56        |
| 2.3.             | Why Has a Specific Organism Chosen Specific Elements for Its Specific Needs?       | 58        |
| 2.4.             | Behaviors of Inorganic Elements-I: Fundamentals of Coordination Chemistry          | 58        |
| 2.4.1.           | Coordination Compounds or Metal Complexes                                          | 59        |
| 2.4.2.           | Ligand Field Theory—How the Predominant Structure Is Determined                    | 60        |
| 2.4.3.           | Thermodynamic Tendency to Form Coordination Compounds                              | 64        |
| 2.4.4.           | Chelate Effect                                                                     | 66        |
| 2.4.5.           | Ligand Substitution Reactions—Kinetic Factors                                      | 67        |
| 2.4.6.           | Oxidation–Reduction and Reduction Potential                                        | 68        |
| 2.5.             | Behaviors of Inorganic Elements-II: Basics of Organometallic Chemistry             | 73        |
| 2.5.1.           | Metal Carbonyls and the 18-Electron ( $18 e^-$ ) Rule                              | 73        |
| 2.5.2.           | Other Organometallic Compounds                                                     | 75        |
| 2.5.3.           | Some Special Types of Reactions Involving Organometallic Compounds                 | 76        |
| <b>CHAPTER 3</b> | <b>How Do Enzymes Work?</b>                                                        | <b>81</b> |
| 3.1.             | Enzymatic Enhancement of Reaction Rate: General Considerations                     | 81        |
| 3.1.1.           | Transition State Theory                                                            | 82        |
| 3.1.2.           | The Dynamic Effects                                                                | 85        |
| 3.1.3.           | A Composite Theory                                                                 | 87        |
| 3.2.             | Metalloenzymes/Proteins and Metal-Activated Enzymes                                | 89        |
| <b>CHAPTER 4</b> | <b>Reactions of Acid-Base Type and the Functions of Metal Cations</b>              | <b>93</b> |
| 4.1.             | General Considerations                                                             | 93        |
| 4.1.1.           | Different Types (Definitions) of Acid-Base                                         | 93        |
| 4.1.2.           | Reactions of Acid-Base Type Catalyzed by Enzymes                                   | 94        |
| 4.1.3.           | Acidity Scale and Acid Character of Metal Cations: Prominence of Zn(II) and Mg(II) | 95        |
| 4.1.4.           | Kinetic Factors                                                                    | 98        |
| 4.1.5.           | Enhancement of Reaction by Protein Residues                                        | 99        |
| 4.2.             | Mg(II)-Dependent Enzymes                                                           | 100       |
| 4.2.1.           | Rubisco (Ribulose 1,5-Bisphosphate Carboxylase/Oxygenase)                          | 100       |
| 4.2.2.           | Pyruvate Kinase                                                                    | 101       |
| 4.3.             | Zn(II)-Dependent Enzymes                                                           | 102       |
| 4.3.1.           | Carbonic Anhydrase                                                                 | 103       |

|                  |                                                                                    |            |
|------------------|------------------------------------------------------------------------------------|------------|
| 4.3.2.           | Thermolysin, Carboxypeptidase A, and Others                                        | 105        |
| 4.3.3.           | Leucine Aminopeptidase                                                             | 106        |
| 4.3.4.           | Alkaline Phosphatase and Purple Acid Phosphatase                                   | 106        |
| 4.3.5.           | Alcohol Dehydrogenase                                                              | 107        |
| 4.4.             | Other Metal Cation-Dependent Acid-Base Enzymes                                     | 108        |
| 4.4.1.           | Aconitase, an Iron-Sulfur Enzyme, and Others                                       | 108        |
| 4.4.2.           | Arginase: Mn Enzyme                                                                | 109        |
| 4.4.3.           | Urease and Other Ni Enzymes                                                        | 109        |
| 4.5.             | Structural Effects of Metal Ions                                                   | 111        |
| 4.6.             | Metal Ions and Polynucleic Acids (DNA and RNA)                                     | 112        |
| 4.6.1.           | General Characteristics of Interactions of Metal Ions with Polynucleotides         | 113        |
| 4.6.1.1.         | Effects on Structures                                                              | 113        |
| 4.6.1.2.         | Catalytic Metal Ions in DNA Polymerases and Nucleases                              | 114        |
| 4.6.2.           | Gene Regulation and Metal Ions                                                     | 116        |
| 4.6.3.           | Ribozymes                                                                          | 117        |
| <b>CHAPTER 5</b> | <b>Reactions of Oxidation–Reduction Type Including Electron Transfer Processes</b> | <b>123</b> |
| 5.1.             | General Consideration                                                              | 123        |
| 5.1.1.           | Reduction Potential                                                                | 124        |
| 5.1.1.1.         | Heme Proteins and Enzymes                                                          | 124        |
| 5.1.1.2.         | Iron-Sulfur Proteins                                                               | 127        |
