

Table of Contents

CHAPTER 1	Basic Genetics	1
CHAPTER 2	Cells and Organisms	21
CHAPTER 3	DNA, RNA and Protein	51
CHAPTER 4	Genes, Genomes and DNA	75
CHAPTER 5	Cell Division and DNA Replication	103
CHAPTER 6	Transcription of Genes	132
CHAPTER 7	Protein Structure and Function	154
CHAPTER 8	Protein Synthesis	197
CHAPTER 9	Regulation of Transcription in Prokaryotes	234
CHAPTER 10	Regulation of Transcription in Eukaryotes	262
CHAPTER 11	Regulation at the RNA Level	281
CHAPTER 12	Processing of RNA	302
CHAPTER 13	Mutations	333
CHAPTER 14	Recombination and Repair	368
CHAPTER 15	Mobile DNA	396
CHAPTER 16	Plasmids	425
CHAPTER 17	Viruses	453
CHAPTER 18	Bacterial Genetics	484
CHAPTER 19	Diversity of Lower Eukaryotes	508
CHAPTER 20	Molecular Evolution	533
CHAPTER 21	Nucleic Acids: Isolation, Purification, Detection, and Hybridization	567
CHAPTER 22	Recombinant DNA Technology	599
CHAPTER 23	The Polymerase Chain Reaction	634
CHAPTER 24	Genomics and DNA Sequencing	662
CHAPTER 25	Analysis of Gene Expression	693
CHAPTER 26	Proteomics: The Global Analysis of Proteins	717
	Glossary	745
	Index	771

Detailed Contents

CHAPTER 1 *Basic Genetics*

Gregor Mendel Was the Father of Classical Genetics	1
Genes Determine Each Step in Biochemical Pathways	2
Mutants Result from Alterations in Genes	3
Phenotypes and Genotypes	4
Chromosomes Are Long, Thin Molecules That Carry Genes	5
Different Organisms may Have Different Numbers of Chromosomes	6
Dominant and Recessive Alleles	7
Partial Dominance, Co-Dominance, Penetrance and Modifier Genes	8
Genes from Both Parents Are Mixed by Sexual Reproduction	9
Sex Determination and Sex-Linked Characteristics	11
Neighboring Genes Are Linked during Inheritance	13
Recombination during Meiosis Ensures Genetic Diversity	15
<i>Escherichia coli</i> Is a Model for Bacterial Genetics	16

CHAPTER 2 *Cells and Organisms*

What Is Life?	21
Living Creatures Are Made of Cells	22
Essential Properties of a Living Cell	23
Prokaryotic Cells Lack a Nucleus	23
Eubacteria and Archaeobacteria Are Genetically Distinct	27
Bacteria Were Used for Fundamental Studies of Cell Function	28
<i>Escherichia coli</i> (<i>E. coli</i>) Is a Model Bacterium	29
Where Are Bacteria Found in Nature?	31
Some Bacteria Cause Infectious Disease, but Most Are Beneficial	32
Eukaryotic Cells Are Sub-Divided into Compartments	34
The Diversity of Eukaryotes	34
Eukaryotes Possess Two Basic Cell Lineages	36
Organisms Are Classified	36

Some Widely Studied Organisms Serve as Models	40
Yeast Is a Widely Studied Single-Celled Eukaryote	40
A Roundworm and a Fly are Model Multicellular Animals	41
Zebrafish are used to Study Vertebrate Development	42
Mouse and Man	44
<i>Arabidopsis</i> Serves as a Model for Plants	44
Haploidy, Diploidy and the Eukaryote Cell Cycle	45
Viruses Are Not Living Cells	46
Bacterial Viruses Infect Bacteria	47
Human Viral Diseases Are Common	48
A Variety of Subcellular Genetic Entities Exist	49

CHAPTER 3 *DNA, RNA and Protein*

Nucleic Acid Molecules Carry Genetic Information	51
Chemical Structure of Nucleic Acids	52
DNA and RNA Each Have Four Bases	52
Nucleosides Are Bases Plus Sugars; Nucleotides Are Nucleosides Plus Phosphate	54
Double Stranded DNA Forms a Double Helix	55
Base Pairs are Held Together by Hydrogen Bonds	56
Complementary Strands Reveal the Secret of Heredity	57
Constituents of Chromosomes	59
The Central Dogma Outlines the Flow of Genetic Information	60
Ribosomes Read the Genetic Code	63
The Genetic Code Dictates the Amino Acid Sequence of Proteins	65
Various Classes of RNA Have Different Functions	67
Proteins, Made of Amino Acids, Carry Out Many Cell Functions	69
The Structure of Proteins Has Four Levels of Organization	70
Proteins Vary in Their Biological Roles	71

CHAPTER 4 *Genes, Genomes and DNA* 75

History of DNA as the Genetic Material	76
How Much Genetic Information Is Necessary to Maintain Life?	78
Non-Coding DNA	78
Coding DNA May Be Present within Non-coding DNA	80
Repeated Sequences Are a Feature of DNA in Higher Organisms	81
Satellite DNA Is Non-coding DNA in the Form of Tandem Repeats	83
Minisatellites and VNTRs	84
Origin of Selfish DNA and Junk DNA	84
Palindromes, Inverted Repeats and Stem and Loop Structures	86
Multiple A-Tracts Cause DNA to Bend	87
Supercoiling is Necessary for Packaging of Bacterial DNA	88
Topoisomerases and DNA Gyrase	89
Catenated and Knotted DNA Must Be Corrected	91
Local Supercoiling	91
Supercoiling Affects DNA Structure	91
Alternative Helical Structures of DNA Occur	92
Histones Package DNA in Eukaryotes	95
Further Levels of DNA Packaging in Eukaryotes	96
Melting Separates DNA Strands; Cooling Anneals Them	100

CHAPTER 5 *Cell Division and DNA Replication* 103

Cell Division and Reproduction Are Not Always Identical	104
DNA Replication Is a Two-Stage Process Occurring at the Replication Fork	104
Supercoiling Causes Problems for Replication	105
Strand Separation Precedes DNA Synthesis	107
Properties of DNA Polymerase	107
Polymerization of Nucleotides	109
Supplying the Precursors for DNA Synthesis	109
DNA Polymerase Elongates DNA Strands	111
The Complete Replication Fork Is Complex	112
Discontinuous Synthesis of DNA Requires a Primosome	114
Completing the Lagging Strand	116

Chromosome Replication Initiates at <i>oriC</i>	118
DNA Methylation and Attachment to the Membrane Control Initiation of Replication	120
Chromosome Replication Terminates at <i>terC</i>	121
Disentangling the Daughter Chromosomes	122
Cell Division in Bacteria Occurs after Replication of Chromosomes	124
How Long Does It Take for Bacteria to Replicate?	124
The Concept of the Replicon	125
Replicating Linear DNA in Eukaryotes	126
Eukaryotic Chromosomes Have Multiple Origins	129
Synthesis of Eukaryotic DNA	130
Cell Division in Higher Organisms	130

CHAPTER 6 *Transcription of Genes* 132

Genes are Expressed by Making RNA	133
Short Segments of the Chromosome Are Turned into Messages	134
Terminology: Cistrons, Coding Sequences and Open Reading Frames	134
How Is the Beginning of a Gene Recognized?	135
Manufacturing the Message	137
RNA Polymerase Knows Where to Stop	138
How Does the Cell Know Which Genes to Turn On?	140
What Activates the Activator?	141
Negative Regulation Results from the Action of Repressors	143
Many Regulator Proteins Bind Small Molecules and Change Shape	144
Transcription in Eukaryotes Is More Complex	145
Transcription of rRNA and tRNA in Eukaryotes	146
Transcription of Protein-Encoding Genes in Eukaryotes	148
Upstream Elements Increase the Efficiency of RNA Polymerase II Binding	151
Enhancers Control Transcription at a Distance	152

CHAPTER 7 *Protein Structure and Function* 154

Proteins Are Formed from Amino Acids	155
Formation of Polypeptide Chains	155
Twenty Amino Acids Form Biological Polypeptides	155
Amino Acids Show Asymmetry around the Alpha-carbon	158

The Structure of Proteins Reflects Four Levels of Organization	160
The Secondary Structure of Proteins Relies on Hydrogen Bonds	160
The Tertiary Structure of Proteins	163
A Variety of Forces Maintain the 3-D Structure of Proteins	165
Cysteine Forms Disulfide Bonds	166
Multiple Folding Domains in Larger Proteins	166
Quaternary Structure of Proteins	167
Higher Level Assemblies and Self-Assembly	169
Cofactors and Metal Ions Are Often Associated with Proteins	169
Nucleoproteins, Lipoproteins and Glycoproteins Are Conjugated Proteins	172
Proteins Serve Numerous Cellular Functions	174
Protein Machines	177
Enzymes Catalyze Metabolic Reactions	177
Enzymes Have Varying Specificities	179
Lock and Key and Induced Fit Models Describe Substrate Binding	181
Enzymes Are Named and Classified According to the Substrate	181
Enzymes Act by Lowering the Energy of Activation	182
The Rate of Enzyme Reactions	184
Substrate Analogs and Enzyme Inhibitors Act at the Active Site	184
Enzymes May Be Directly Regulated	187
Allosteric Enzymes Are Affected by Signal Molecules	187
Enzymes May Be Controlled by Chemical Modification	189
Binding of Proteins to DNA Occurs in Several Different Ways	190
Denaturation of Proteins	194

CHAPTER 8 Protein Synthesis 197

Protein Synthesis Follows a Plan	198
Proteins Are Gene Products	198
Decoding the Genetic Code	199
Transfer RNA Forms a Flat Cloverleaf Shape and a Folded "L" Shape	200
Modified Bases Are Present in Transfer RNA	201
Some tRNA Molecules Read More Than One Codon	202

Charging the tRNA with the Amino Acid	204
The Ribosome: The Cell's Decoding Machine	204
Three Possible Reading Frames Exist	208
The Start Codon Is Chosen	210
The Initiation Complexes Must Be Assembled	211
The tRNA Occupies Three Sites During Elongation of the Polypeptide	211
Termination of Protein Synthesis Requires Release Factors	213
Several Ribosomes Usually Read the Same Message at Once	214
Bacterial Messenger RNA Can Code for Several Proteins	215
Transcription and Translation Are Coupled in Bacteria	216
Some Ribosomes Become Stalled and Are Rescued	217
Differences between Eukaryotic and Prokaryotic Protein Synthesis	218
Initiation of Protein Synthesis in Eukaryotes	218
Protein Synthesis Is Halted When Resources Are Scarce	221
A Signal Sequence Marks a Protein for Export from the Cell	221
Molecular Chaperones Oversee Protein Folding	224
Protein Synthesis Occurs in Mitochondria and Chloroplasts	225
Proteins Are Imported into Mitochondria and Chloroplasts by Translocases	226
Mistranslation Usually Results in Mistakes in Protein Synthesis	226
The Genetic Code Is Not "Universal"	227
Unusual Amino Acids are Made in Proteins by Post-Translational Modifications	227
Selenocysteine: The 21st Amino Acid	227
Pyrrolysine: The 22nd Amino Acid	228
Many Antibiotics Work by Inhibiting Protein Synthesis	230
Degradation of Proteins	231

CHAPTER 9 Regulation of Transcription in Prokaryotes 234

Gene Regulation Ensures a Physiological Response	235
Regulation at the Level of Transcription Involves Several Steps	236

Alternative Sigma Factors in Prokaryotes Recognize Different Sets of Genes	238
Heat Shock Sigma Factors in Prokaryotes Are Regulated by Temperature	238
Cascades of Alternative Sigma Factors Occur in <i>Bacillus</i> Spore Formation	239
Anti-sigma Factors Inactivate Sigma; Anti-anti-sigma Factors Free It to Act	242
Activators and Repressors Participate in Positive and Negative Regulation	243
The Operon Model of Gene Regulation	244
Some Proteins May Act as Both Repressors and Activators	246
Nature of the Signal Molecule	248
Activators and Repressors May Be Covalently Modified	252
Two-Component Regulatory Systems	253
Phosphorelay Systems	254
Specific Versus Global Control	254
Crp Protein Is an Example of a Global Control Protein	255
Accessory Factors and Nucleoid Binding Proteins	256
Action at a Distance and DNA Looping	257
Anti-termination as a Control Mechanism	258

CHAPTER 10 *Regulation of Transcription in Eukaryotes* **262**

Transcriptional Regulation in Eukaryotes Is More Complex Than in Prokaryotes	263
Specific Transcription Factors Regulate Protein Encoding Genes	264
The Mediator Complex Transmits Information to RNA Polymerase	264
Enhancers and Insulator Sequences Segregate DNA Functionally	265
Matrix Attachment Regions Allow DNA Looping	268
Negative Regulation of Transcription Occurs in Eukaryotes	269
Heterochromatin Causes Difficulty for Access to DNA in Eukaryotes	270
Methylation of DNA in Eukaryotes Controls Gene Expression	273
Silencing of Genes Is Caused by DNA Methylation	275

Genetic Imprinting in Eukaryotes Has Its Basis in DNA Methylation Patterns	275
X-chromosome Inactivation Occurs in Female XX Animals	277

CHAPTER 11 *Regulation at the RNA Level* **281**

Regulation at the Level of RNA	282
Binding of Proteins to mRNA Controls The Rate of Degradation	282
Some mRNA Molecules Must Be Cleaved Before Translation	283
Some Regulatory Proteins May Cause Translational Repression	284
Some Regulatory Proteins Can Activate Translation	287
Translation May Be Regulated by Antisense RNA	288
Regulation of Translation by Alterations to the Ribosome	290
RNA Interference (RNAi)	291
Amplification and Spread of RNAi	292
Experimental Administration of siRNA	293
PTGS in Plants and Quelling in Fungi	294
Micro RNA—A Class of Small Regulatory RNA	295
Premature Termination Causes Attenuation of RNA Transcription	297
Riboswitches—RNA Acting Directly as a Control Mechanism	299

CHAPTER 12 *Processing of RNA* **302**

RNA is Processed in Several Ways	303
Coding and Non-Coding RNA	304
Processing of Ribosomal and Transfer RNA	305
Eukaryotic Messenger RNA Contains a Cap and Tail	305
Capping is the First Step in Maturation of mRNA	306
A Poly(A) Tail is Added to Eukaryotic mRNA	308
Introns are Removed from RNA by Splicing	310
Different Classes of Intron Show Different Splicing Mechanisms	314
Alternative Splicing Produces Multiple Forms of RNA	315

Inteins and Protein Splicing	318
Base Modification of rRNA Requires Guide RNA	322
RNA Editing Involves Altering the Base Sequence	324
Transport of RNA out of the Nucleus	327
Degradation of mRNA	327
Nonsense Mediated Decay of mRNA	328

CHAPTER 13 *Mutations* 333

Mutations Alter the DNA Sequence	334
The Major Types of Mutation	335
Base Substitution Mutations	336
Missense Mutations May Have Major or Minor Effects	336
Nonsense Mutations Cause Premature Polypeptide Chain Termination	338
Deletion Mutations Result in Shortened or Absent Proteins	340
Insertion Mutations Commonly Disrupt Existing Genes	341
Frameshift Mutations Sometimes Produce Abnormal Proteins	343
DNA Rearrangements Include Inversions, Translocations, and Duplications	343
Phase Variation Is Due to Reversible DNA Alterations	345
Silent Mutations Do Not Alter the Phenotype	346
Chemical Mutagens Damage DNA	348
Radiation Causes Mutations	350
Spontaneous Mutations Can Be Caused by DNA Polymerase Errors	351
Mutations Can Result from Mismatching and Recombination	353
Spontaneous Mutation Can Be the Result of Tautomerization	353
Spontaneous Mutation Can Be Caused by Inherent Chemical Instability	353
Mutations Occur More Frequently at Hot Spots	355
How Often Do Mutations Occur?	358
Reversions Are Genetic Alterations That Change the Phenotype Back to Wild-type	359
Reversion Can Occur by Compensatory Changes in Other Genes	361
Altered Decoding by Transfer RNA May Cause Suppression	362
Mutagenic Chemicals Can Be Detected by Reversion	363

Experimental Isolation of Mutations	364
<i>In Vivo</i> versus <i>In Vitro</i> Mutagenesis	365
Site-Directed Mutagenesis	366

CHAPTER 14 *Recombination and Repair* 368

Overview of Recombination	369
Molecular Basis of Homologous Recombination	370
Single-Strand Invasion and Chi Sites	371
Site-Specific Recombination	373
Recombination in Higher Organisms	376
Overview of DNA Repair	378
DNA Mismatch Repair System	379
General Excision Repair System	381
DNA Repair by Excision of Specific Bases	383
Specialized DNA Repair Mechanisms	384
Photoreactivation Cleaves Thymine Dimers	387
Transcriptional Coupling of Repair	387
Repair by Recombination	388
SOS Error Prone Repair in Bacteria	388
Repair in Eukaryotes	391
Double-Strand Repair in Eukaryotes	392
Gene Conversion	392

CHAPTER 15 *Mobile DNA* 396

Sub-Cellular Genetic Elements as Gene Creatures	397
Most Mobile DNA Consists of Transposable Elements	397
The Essential Parts of a Transposon	398
Insertion Sequences—the Simplest Transposons	400
Movement by Conservative Transposition	401
Complex Transposons Move by Replicative Transposition	402
Replicative and Conservative Transposition are Related	406
Composite Transposons	406
Transposition may Rearrange Host DNA	408
Transposons in Higher Life Forms	410
Retro-Elements Make an RNA Copy	412
Repetitive DNA of Mammals	414
Retro-Insertion of Host-Derived DNA	415
Retrons Encode Bacterial Reverse Transcriptase	416
The Multitude of Transposable Elements	417

Bacteriophage Mu is a Transposon	417
Conjugative Transposons	420
Integrans Collect Genes for Transposons	420
Junk DNA and Selfish DNA	422
Homing Introns	423

CHAPTER 16 *Plasmids* **425**

Plasmids as Replicons	426
General Properties of Plasmids	427
Plasmid Families and Incompatibility	428
Occasional Plasmids are Linear or Made of RNA	428
Plasmid DNA Replicates by Two Alternative Methods	430
Control of Copy Number by Antisense RNA	432
Plasmid Addiction and Host Killing Functions	435
Many Plasmids Help their Host Cells	436
Antibiotic Resistance Plasmids	436
Mechanism of Antibiotic Resistance	438
Resistance to Beta-Lactam Antibiotics	438
Resistance to Chloramphenicol	439
Resistance to Aminoglycosides	440
Resistance to Tetracycline	441
Resistance to Sulfonamides and Trimethoprim	442
Plasmids may Provide Aggressive Characters	442
Most Colicins Kill by One of Two Different Mechanisms	444
Bacteria are Immune to their own Colicins	445
Colicin Synthesis and Release	446
Virulence Plasmids	446
Ti-Plasmids are Transferred from Bacteria to Plants	447
The 2 Micron Plasmid of Yeast	450
Certain DNA Molecules may Behave as Viruses or Plasmids	451

CHAPTER 17 *Viruses* **453**

Viruses are Infectious Packages of Genetic Information	454
Life Cycle of a Virus	455
Bacterial Viruses are Known as Bacteriophage	458
Lysogeny or Latency by Integration	460
The Great Diversity of Viruses	462
Small Single-Stranded DNA Viruses of Bacteria	463
Complex Bacterial Viruses with Double Stranded DNA	465

DNA Viruses of Higher Organisms	466
Viruses with RNA Genomes Have Very Few Genes	467
Bacterial RNA Viruses	469
Double Stranded RNA Viruses of Animals	469
Positive-Stranded RNA Viruses Make Polyproteins	469
Strategy of Negative-Strand RNA Viruses	470
Plant RNA Viruses	470
Retroviruses Use both RNA and DNA	472
Genome of the Retrovirus	477
Subviral Infectious Agents	477
Satellite Viruses	479
Viroids are Naked Molecules of Infectious RNA	480
Prions are Infectious Proteins	481

CHAPTER 18 *Bacterial Genetics* **484**

Reproduction versus Gene Transfer	485
Fate of the Incoming DNA after Uptake	485
Transformation is Gene Transfer by Naked DNA	487
Transformation as Proof that DNA is the Genetic Material	488
Transformation in Nature	491
Gene Transfer by Virus—Transduction	493
Generalized Transduction	493
Specialized Transduction	494
Transfer of Plasmids between Bacteria	495
Transfer of Chromosomal Genes Requires Plasmid Integration	496
Gene Transfer among Gram-Positive Bacteria	501
Archaeobacterial Genetics	504
Whole Genome Sequencing	506

CHAPTER 19 *Diversity of Lower Eukaryotes* **508**

Origin of the Eukaryotes by Symbiosis	509
The Genomes of Mitochondria and Chloroplasts	510
Primary and Secondary Endosymbiosis	511
Is Malaria Really a Plant?	512
Symbiosis: Parasitism versus Mutualism	515
Bacterial Endosymbionts of Killer <i>Paramecium</i>	515
Is <i>Buchnera</i> an Organelle or a Bacterium?	517
Ciliates have Two Types of Nucleus	517
Trypanosomes Vary Surface Proteins to Outwit the Immune System	520

Mating Type Determination in Yeast	525
Multi-Cellular Organisms and Homeobox Genes	530

CHAPTER 20 Molecular Evolution 533

Getting Started—Formation of the Earth	534
The Early Atmosphere	534
Oparin's Theory of the Origin of Life	535
The Miller Experiment	536
Polymerization of Monomers to Give Macromolecules	538
Enzyme Activities of Random Proteinoids	539
Origin of Informational Macromolecules	540
Ribozymes and the RNA World	540
The First Cells	542
The Autotrophic Theory of the Origin of Metabolism	544
Evolution of DNA, RNA and Protein Sequences	545
Creating New Genes by Duplication	547
Paralogous and Orthologous Sequences	549
Creating New Genes by Shuffling	550
Different Proteins Evolve at Very Different Rates	550
Molecular Clocks to Track Evolution	552
Ribosomal RNA—A Slowly Ticking Clock	552
The Archaeobacteria versus the Eubacteria	554
DNA Sequencing and Biological Classification	555
Mitochondrial DNA—A Rapidly Ticking Clock	559
The African Eve Hypothesis	560
Ancient DNA from Extinct Animals	562
Evolving Sideways: Horizontal Gene Transfer	564
Problems in Estimating Horizontal Gene Transfer	565

CHAPTER 21 Nucleic Acids: Isolation, Purification, Detection, and Hybridization 567

Isolation of DNA	568
Purification of DNA	568
Removal of Unwanted RNA	569
Gel Electrophoresis of DNA	570
Pulsed Field Gel Electrophoresis	572
Denaturing Gradient Gel Electrophoresis	573

Chemical Synthesis of DNA	574
Chemical Synthesis of Complete Genes	580
Peptide Nucleic Acid	580
Measuring the Concentration DNA and RNA with Ultraviolet Light	582
Radioactive Labeling of Nucleic Acids	583
Detection of Radio-Labeled DNA	583
Fluorescence in the Detection of DNA and RNA	585
Chemical Tagging with Biotin or Digoxigenin	587
The Electron Microscope	588
Hybridization of DNA and RNA	590
Southern, Northern, and Western Blotting	592
Zoo Blotting	595
Fluorescence in Situ Hybridization (FISH)	595
Molecular Beacons	598

CHAPTER 22 Recombinant DNA Technology 599

Introduction	600
Nucleases Cut Nucleic Acids	600
Restriction and Modification of DNA	600
Recognition of DNA by Restriction Endonucleases	601
Naming of Restriction Enzymes	601
Cutting of DNA by Restriction Enzymes	602
DNA Fragments are Joined by DNA Ligase	603
Making a Restriction Map	604
Restriction Fragment Length Polymorphisms	607
Properties of Cloning Vectors	608
Multicopy Plasmid Vectors	610
Inserting Genes into Vectors	610
Detecting Insertions in Vectors	612
Moving Genes between Organisms: Shuttle Vectors	615
Bacteriophage Lambda Vectors	616
Cosmid Vectors	617
Yeast Artificial Chromosomes	620
Bacterial and P1 Artificial Chromosomes	620
A DNA Library Is a Collection of Genes from One organism	621
Screening a Library by Hybridization	623
Screening a Library by Immunological Procedures	623
Cloning Complementary DNA Avoids Introns	624
Chromosome Walking	626

Cloning by Subtractive Hybridization	628
Expression Vectors	631

CHAPTER 23 *The Polymerase Chain Reaction* 634

Fundamentals of the Polymerase Chain Reaction	635
Cycling Through the PCR	638
Degenerate Primers	640
Inverse PCR	641
Adding Artificial Restriction Sites	642
TA Cloning by PCR	643
Randomly Amplified Polymorphic DNA (RAPD)	643
Reverse Transcriptase PCR	646
Differential Display PCR	647
Rapid Amplification of cDNA Ends (RACE)	649
PCR in Genetic Engineering	649
Directed Mutagenesis	651
Engineering Deletions and Insertions by PCR	651
Use of PCR in Medical Diagnosis	652
Environmental Analysis by PCR	653
Rescuing DNA from Extinct Life Forms by PCR	654
Realtime Fluorescent PCR	655
Inclusion of Molecular Beacons in PCR—Scorpion Primers	656
Rolling Circle Amplification Technology (RCAT)	657

CHAPTER 24 *Genomics and DNA Sequencing* 662

Introduction to Genomics	663
DNA Sequencing—General Principle	663
The Chain Termination Method for Sequencing DNA	663
DNA Polymerases for Sequencing DNA	668
Producing Template DNA for Sequencing	668
Primer Walking along a Strand of DNA	670
Automated Sequencing	670
The Emergence of DNA Chip Technology	672
The Oligonucleotide Array Detector	672
Pyrosequencing	674
Nanopore Detectors for DNA	676
Large Scale Mapping with Sequence Tags	676

Mapping of Sequence Tagged Sites	677
Assembling Small Genomes by Shotgun Sequencing	680
Race for the Human Genome	680
Assembling a Genome from Large Cloned Contigs	683
Assembling a Genome by Directed Shotgun Sequencing	683
Survey of the Human Genome	683
Sequence Polymorphisms: SSLPs and SNPs	686
Gene Identification by Exon Trapping	688
Bioinformatics and Computer Analysis	690

CHAPTER 25 *Analysis of Gene Expression* 693

Introduction	694
Monitoring Gene Expression	694
Reporter Genes for Monitoring Gene Expression	694
Easily Assayable Enzymes as Reporters	696
Light Emission by Luciferase as a Reporter System	696
Green Fluorescent Protein as a Reporter	699
Gene Fusions	699
Deletion Analysis of the Upstream Region	702
Locating Protein Binding Sites in the Upstream Region	702
Location of the Start of Transcription by Primer Extension	706
Location of the Start of Transcription by S1 Nuclease	707
Transcriptome Analysis	709
DNA Microarrays for Gene Expression	709
Serial Analysis of Gene Expression (SAGE)	713

CHAPTER 26 *Proteomics: The Global Analysis of Proteins* 717

Introduction to Proteomics	718
Gel Electrophoresis of Proteins	719
Two Dimensional PAGE of Proteins	720
Western Blotting of Proteins	722
Mass Spectrometry for Protein Identification	722
Protein Tagging Systems	726
Full-Length Proteins Used as Fusion Tags	726
Self Cleavable Intein Tags	729

Selection by Phage Display	729
Protein Interactions: The Yeast Two-Hybrid System	732
Protein Interaction by Co-Immunoprecipitation	737
Protein Arrays	741

Metabolomics	741
Glossary	745
Index	771
