## **Section I. Mathematical and Computational Methods 1**

### **1. DNA-Binding Specificity Prediction with FoldX 3**

Alejandro D. Nadra, Luis Serrano, and Andreu Alibés

|                                                                                                        |    |
|--------------------------------------------------------------------------------------------------------|----|
| 1. Introduction                                                                                        | 4  |
| 2. Description of the Force Field, FoldX, and the Implementation of DNA Energy Terms and Base Mutation | 5  |
| 3. Predicting Specificities                                                                            | 9  |
| 4. Changing Binding Capabilities                                                                       | 12 |
| 5. Designing New Specificities                                                                         | 13 |
| 6. Known Caveats                                                                                       | 14 |
| 7. Conclusions and Future Outlook                                                                      | 16 |
| Acknowledgments                                                                                        | 16 |
| References                                                                                             | 17 |

### **2. The Ribosome Binding Site Calculator 19**

Howard M. Salis

|                                                                  |    |
|------------------------------------------------------------------|----|
| 1. Introduction                                                  | 20 |
| 2. Applications of the RBS Calculator                            | 22 |
| 3. RBSs and Bacterial Translation                                | 24 |
| 4. A Biophysical Model and Optimization Method for RBSs          | 27 |
| 5. Precise Measurements of Fluorescent Protein Expression Levels | 38 |
| Acknowledgments                                                  | 40 |
| References                                                       | 41 |

### **3. Designing Genes for Successful Protein Expression 43**

Mark Welch, Alan Villalobos, Claes Gustafsson, and Jeremy Minshull

|                                                             |    |
|-------------------------------------------------------------|----|
| 1. Introduction                                             | 44 |
| 2. Gene Design Software                                     | 45 |
| 3. General Sequence Parameters Affecting Protein Expression | 45 |

|                                                                                                                             |            |
|-----------------------------------------------------------------------------------------------------------------------------|------------|
| 4. Protein-Specific Factors Providing Additional Complexity                                                                 | 56         |
| 5. Conclusions                                                                                                              | 61         |
| References                                                                                                                  | 62         |
| <b>4. Application of Metabolic Flux Analysis in Metabolic Engineering</b>                                                   | <b>67</b>  |
| Sang Yup Lee, Jong Myoung Park, and Tae Yong Kim                                                                            |            |
| 1. Introduction                                                                                                             | 68         |
| 2. General Structure of Constraints-Based Flux Analysis                                                                     | 70         |
| 3. Algorithms of Metabolic Flux Analysis                                                                                    | 73         |
| 4. Concluding Remarks                                                                                                       | 85         |
| Acknowledgments                                                                                                             | 86         |
| References                                                                                                                  | 87         |
