

CONTENTS

Preface	xv
1 Biosystem Modeling & Simulation: Nomenclature & Philosophy	1
Overview	3
Modeling Definitions	3
Modeling Essential System Features	7
Primary Focus: Dynamic (Dynamical) System Models	11
Measurement Models & Dynamic System Models Combined: Important!	15
Stability	17
Top-Down & Bottom-Up Modeling	20
Source & Sink Submodels: One Paradigm for Biomodeling with Subsystem Components	21
Systems, Integration, Computation & Scale in Biology	22
Overview of the Modeling Process & Biomodeling Goals	27
Looking Ahead: A Top-Down Model of the Chapters	34
References	36
2 Math Models of Systems: Biomodeling 101	39
Some Basics & a Little Philosophy	41
Algebraic or Differential Equation Models	42
Differential & Difference Equation Models	43
Different Kinds of Differential & Difference Equation Models	45
Linear & Nonlinear Mathematical Models	47
Piecewise-Linearized Models: Mild/Soft Nonlinearities	52
Solution of Ordinary Differential (ODE) & Difference Equation (DE) Models	53
Special Input Forcing Functions (Signals) & Their Model Responses: Steps & Impulses	58

State Variable Models of Continuous-Time Systems	61
Linear Time-Invariant (TI) Discrete-Time Difference Equations (DEs) & Their Solution	65
Linearity & Superposition	69
Laplace Transform Solution of ODEs	70
Transfer Functions of Linear TI ODE Models	75
More on System Stability	79
Looking Ahead	80
Exercises	82
References	83
 3 Computer Simulation Methods	 85
Overview	88
Initial-Value Problems	90
Graphical Programming of ODEs	90
Time-Delay Simulations	96
Multiscale Simulation and Time-Delays	99
Normalization of ODEs: Magnitude- & Time-Scaling	104
Numerical Integration Algorithms: Overview	109
The Taylor Series	110
Taylor Series Algorithms for Solving Ordinary Differential Equations	112
Computational/Numerical Stability	116
Self-Starting ODE Solution Methods	117
Algorithms for Estimating and Controlling Stepwise Precision	122
Taylor Series-Based Method Comparisons	124
Stiff ODE Problems	126
How to Choose a Solver?	129
Solving DIFFERENCE Equations (DEs) Using an ODE Solver	131
Other Simulation Languages & Software Packages	133
Two Population Interaction Dynamics Simulation Model Examples	135
Taking Stock & Looking Ahead	138
Exercises	139
References	142
 4 Structural Biomodeling from Theory & Data: Compartmentalizations	 143
Introduction	145
Compartmentalization: A First-Level Formalism for Structural Biomodeling	146

Mathematics of Multicompartmental Modeling from the Biophysics	157
Nonlinear Multicompartmental Biomodels: Special Properties & Solutions	170
Dynamic System Nonlinear Epidemiological Models	174
Compartment Sizes, Concentrations & the Concept of Equivalent Distribution Volumes	177
General n -Compartment Models with Multiple Inputs & Outputs	180
Data-Driven Modeling of Indirect & Time-Delayed Inputs	191
Pools & Pool Models: Accommodating Inhomogeneities	195
Recap & Looking Ahead	197
Exercises	198
References	202
 5 Structural Biomodeling from Theory & Data: Sizing, Distinguishing & Simplifying Multicompartmental Models	 205
Introduction	207
Output Data (Dynamical Signatures) Reveal Dynamical Structure	207
Multicompartmental Model Dimensionality, Modal Analysis & Dynamical Signatures	210
Model Simplification: Hidden Modes & Additional Insights	224
Biomodel Structure Ambiguities: Model Discrimination, Distinguishability & Input–Output Equivalence	227
Algebra and Geometry of MC Model Distinguishability	235
Reducible, Cyclic & Other MC Model Properties	238
Tracers, Tracees & Linearizing Perturbation Experiments	239
Recap and Looking Ahead	246
Exercises	247
References	251
 6 Nonlinear Mass Action & Biochemical Kinetic Interaction Modeling	 253
Overview	255
Kinetic Interaction Models	256
Law of Mass Action	266
Reaction Dynamics in Open Biosystems	268
Enzymes & Enzyme Kinetics	270
Enzymes & Introduction to Metabolic and Cellular Regulation	283
Exercises	295

Extensions: Quasi-Steady State Assumption Theory	296
References	303
7 Cellular Systems Biology Modeling: Deterministic & Stochastic	307
Overview	309
Enzyme-Kinetics Submodels Extrapolated to Other Biomolecular Systems	309
Coupled-Enzymatic Reactions & Protein Interaction Network (PIN) Models	318
Production, Elimination & Regulation Combined: Modeling Source, Sink & Control Components	320
The Stoichiometric Matrix N	322
Special Purpose Modeling Packages in Biochemistry, Cell Biology & Related Fields	325
Stochastic Dynamic Molecular Biosystem Modeling	330
When a Stochastic Model is Preferred	330
Stochastic Process Models & the Gillespie Algorithm	331
Exercises	340
References	343
8 Physiologically Based, Whole-Organism Kinetics & Noncompartmental Modeling	345
Overview	348
Physiologically Based (PB) Modeling	349
Experiment Design Issues in Kinetic Analysis (Caveats)	372
Whole-Organism Parameters: Kinetic Indices of Overall Production, Distribution & Elimination	375
Noncompartmental (NC) Biodeling & Analysis (NCA)	385
Recap & Looking Ahead	397
Exercises	398
References	400
9 Biosystem Stability & Oscillations	403
Overview/Introduction	405
Stability of NL Biosystem Models	407
Stability of Linear System Models	412
Local Nonlinear Stability via Linearization	413
Bifurcation Analysis	414
Oscillations in Biology	416
Other Complex Dynamical Behaviors	420

Nonlinear Modes	428
Recap & Looking Ahead	430
Exercises	431
References	433
10 Structural Identifiability	435
Introduction	437
Basic Concepts	442
Formal Definitions: Constrained Structures, Structural Identifiability & Identifiable Combinations	454
Unidentifiable Models	457
SI Under Constraints: Interval Identifiability with Some Parameters Known	464
SI Analysis of Nonlinear (NL) Biomodels	471
What's Next?	482
Exercises	483
References	485
11 Parameter Sensitivity Methods	489
Introduction	491
Sensitivity to Parameter Variations: The Basics	492
State Variable Sensitivities to Parameter Variations	495
Output Sensitivities to Parameter Variations	503
*Output Parameter Sensitivity Matrix & Structural Identifiability	508
**Global Parameter Sensitivities	517
Recap & Looking Ahead	518
Exercises	519
References	520
12 Parameter Estimation & Numerical Identifiability	521
Biomodel Parameter Estimation (Identification)	523
Residual Errors & Parameter Optimization Criteria	531
Parameter Optimization Methods 101: Analytical and Numerical	536
Parameter Estimation Quality Assessments	543
Other Biomodel Quality Assessments	554
Recap and Looking Ahead	556
Exercises	557
References	558

13 Parameter Estimation Methods II: Facilitating, Simplifying & Working With Data	559
Overview	561
Prospective Simulation Approach to Model Reliability Measures	563
Constraint-Simplified Model Quantification	572
Model Reparameterization & Quantifying the Identifiable Parameter Combinations	576
The Forcing-Function Method	583
Multiexponential (ME) Models & Use as Forcing Functions	586
Model Fitting & Refitting With Real Data	588
Recap and Looking Ahead	592
Exercises	592
References	594
14 Biocontrol System Modeling, Simulation, and Analysis	595
Overview	597
Physiological Control System Modeling	597
Neuroendocrine Physiological System Models	599
Structural Modeling & Analysis of Biochemical & Cellular Control Systems	610
Transient and Steady-State Biomolecular Network Modeling	617
Metabolic Control Analysis (MCA)	624
Recap and Looking Ahead	626
Exercises	627
References	628
15 Data-Driven Modeling and Alternative Hypothesis Testing	633
Overview	635
Statistical Criteria for Discriminating Among Alternative Models	636
Macroscale and Mesoscale Models for Elucidating Biomechanisms	638
Mesoscale Mechanistic Models of Biochemical/Cellular Control Systems	641
Candidate Models for p53 Regulation	651
Recap and Looking Ahead	666
Exercises	668
References	668

16 Experiment Design and Optimization	671
Overview	673
A Formal Model for Experiment Design	673
Input–Output Experiment Design from the TF Matrix	676
Graphs and Cutset Analysis for Experiment Design	685
Algorithms for Optimal Experiment Design	693
Sequential Optimal Experiment Design	697
Recap and Looking Ahead	699
Exercises	702
References	702
 17 Model Reduction and Network Inference in Dynamic Systems Biology	 705
Overview	707
Local and Global Parameter Sensitivities	708
Model Reduction Methodology	708
Parameter Ranking	709
Added Benefits: State Variables to Measure and Parameters to Estimate	710
GSA Algorithms	716
What's Next?	721
Exercises	722
References	722
 Appendix A: A Short Course in Laplace Transform Representations & ODE Solutions	725
Appendix B: Linear Algebra for Biosystem Modeling	739
Appendix C: Input–Output & State Variable Biosystem Modeling: Going Deeper	759
Appendix D: Controllability, Observability, & Reachability	787
Appendix E: Decomposition, Equivalence, Minimal & Canonical State Variable Models	809
Appendix F: More On Simulation Algorithms & Model Information Criteria	833
Index	843
