## **CHAPTER 1 Mechanisms of Gene Regulation: Boolean Network Models of the Lactose Operon in *Escherichia coli* .... 1**

*Raina Robeva, Bessie Kirkwood and Robin Davies*

|                                                                                          |    |
|------------------------------------------------------------------------------------------|----|
| 1.1 Introduction .....                                                                   | 1  |
| 1.2 <i>E. coli</i> and the <i>lac</i> operon.....                                        | 3  |
| 1.3 Boolean Network Models of the <i>Lac</i> Operon .....                                | 6  |
| 1.3.1 Identifying the Model Variables and Parameters .....                               | 7  |
| 1.3.2 Boolean Network Models.....                                                        | 9  |
| 1.3.3 Creating a Boolean Model of the <i>Lac</i> Operon .....                            | 14 |
| 1.3.4 Initial Testing of the Boolean Model of the <i>Lac</i> Operon from Eqs. (1.4)..... | 16 |
| 1.3.5 Using Discrete Visualizer of Dynamics (DVD) to Test a Boolean Model.....           | 17 |
| 1.3.6 How to Recognize a Deficient Model .....                                           | 21 |
| 1.3.7 A More Refined Boolean Model of the <i>Lac</i> Operon .....                        | 23 |
| 1.4 Determining the Fixed Points of Boolean Networks .....                               | 25 |
| 1.5 Conclusions and Discussion.....                                                      | 31 |
| 1.6 Supplementary Materials .....                                                        | 34 |
| References.....                                                                          | 34 |

## **CHAPTER 2 Bistability in the Lactose Operon of *Escherichia coli*: A Comparison of Differential Equation and Boolean Network Models ..... 37**

*Raina Robeva and Necmettin Yildirim*

|                                                                      |    |
|----------------------------------------------------------------------|----|
| 2.1 Introduction .....                                               | 37 |
| 2.2 The Lactose Operon of <i>Escherichia Coli</i> .....              | 39 |
| 2.3 Modeling Biochemical Reactions with Differential Equations ..... | 40 |
| 2.3.1 Enzymatic Reactions and the Michaelis-Menten Equation .....    | 42 |
| 2.3.2 Multi-Molecule Binding and Hill Equations.....                 | 44 |

|                  |                                                                                                                   |            |
|------------------|-------------------------------------------------------------------------------------------------------------------|------------|
| 2.4              | The Yildirim-Mackey Differential Equation Models<br>for the Lactose Operon.....                                   | 47         |
| 2.4.1            | Model Justification .....                                                                                         | 47         |
| 2.4.2            | Numerical Simulation of the Yildirim-Mackey<br>Models and Bistability .....                                       | 52         |
| 2.5              | Boolean Modeling of Biochemical Interactions .....                                                                | 57         |
| 2.6              | Boolean Approximations of the Yildirim-Mackey Models.....                                                         | 60         |
| 2.6.1            | Boolean Variants of the 3-Variable Model .....                                                                    | 60         |
| 2.6.2            | Boolean Variants of the 5-Variable Model .....                                                                    | 65         |
| 2.7              | Conclusions and Discussion.....                                                                                   | 70         |
| 2.8              | Supplementary Materials .....                                                                                     | 73         |
|                  | References.....                                                                                                   | 73         |
| <b>CHAPTER 3</b> | <b>Inferring the Topology of Gene Regulatory Networks:<br/>An Algebraic Approach to Reverse Engineering .....</b> | <b>75</b>  |
|                  | <i>Brandilyn Stigler and Elena Dimitrova</i>                                                                      |            |
| 3.1              | Introduction .....                                                                                                | 75         |
| 3.1.1            | Gene Regulatory Networks in Molecular Biology .....                                                               | 75         |
| 3.1.2            | Reverse Engineering of Gene Regulatory Networks .....                                                             | 76         |
| 3.2              | Polynomial Dynamical Systems (PDSs).....                                                                          | 78         |
| 3.3              | Computational Algebra Preliminaries .....                                                                         | 82         |
| 3.4              | Construction of the Model Space:<br>A Reverse Engineering Algorithm .....                                         | 85         |
| 3.5              | Model Selection .....                                                                                             | 89         |
| 3.5.1            | Preprocessing: Minimal Sets Algorithm .....                                                                       | 91         |
| 3.5.2            | Postprocessing: The Gröbner Fan Method .....                                                                      | 93         |
| 3.6              | Discretization .....                                                                                              | 96         |
|                  | References.....                                                                                                   | 100        |
| <b>CHAPTER 4</b> | <b>Global Dynamics Emerging from Local Interactions:<br/>Agent-Based Modeling for the Life Sciences .....</b>     | <b>105</b> |
|                  | <i>David Gammack, Elsa Schaefer and Holly Gaff</i>                                                                |            |
| 4.1              | Introduction .....                                                                                                | 105        |
| 4.1.1            | Agent-Based Modeling and the<br>Biology Mind Set .....                                                            | 105        |
| 4.1.2            | A Brief Note About Platforms.....                                                                                 | 106        |
| 4.1.3            | A Brief History of Agent-Based Modeling.....                                                                      | 109        |
| 4.2              | Axon Guidance.....                                                                                                | 113        |
| 4.2.1            | Background .....                                                                                                  | 113        |
| 4.2.2            | Understanding the Domain: Axon Biology .....                                                                      | 114        |

|                                                                                    |            |
|------------------------------------------------------------------------------------|------------|
| 4.2.3 Breaking Down the Problem .....                                              | 116        |
| 4.2.4 Constructing a Model of Axon Development.....                                | 117        |
| <b>4.3 An Agent-Based Model for Cholera and the Importance of Replication.....</b> | <b>119</b> |
| 4.3.1 Model Description.....                                                       | 120        |
| 4.3.2 ABM Modeling Exercises: Cholera and the NetLogo BehaviorSpace .....          | 123        |
| <b>4.4 Use and Description of ABM in Research:</b>                                 |            |
| Tick-Borne Disease Agent-Based Models.....                                         | 128        |
| 4.4.1 The Model .....                                                              | 129        |
| 4.4.2 Purpose.....                                                                 | 130        |
| 4.4.3 State Variables and Scales .....                                             | 130        |
| 4.4.4 Process Overview and Scheduling .....                                        | 130        |
| 4.4.5 Design Concepts.....                                                         | 131        |
| 4.4.6 Input .....                                                                  | 132        |
| 4.4.7 Simulation Experiments .....                                                 | 132        |
| <b>4.5 Comments for Instructors.....</b>                                           | <b>134</b> |
| <b>4.6 Supplementary Materials .....</b>                                           | <b>137</b> |
| References.....                                                                    | 137        |

## **CHAPTER 5 Agent-Based Models and Optimal Control in Biology: A Discrete Approach ..... 143**

*Reinhard Laubenbacher, Franziska Hinkelmann and Matt Oremland*

|                                                                                  |            |
|----------------------------------------------------------------------------------|------------|
| <b>5.1 Introduction .....</b>                                                    | <b>143</b> |
| <b>5.2 A First Example.....</b>                                                  | <b>147</b> |
| <b>5.3 Netlogo: An Introduction .....</b>                                        | <b>148</b> |
| <b>5.4 An Introduction to Agent-Based Models.....</b>                            | <b>149</b> |
| <b>5.5 Optimization and Optimal Control.....</b>                                 | <b>152</b> |
| <b>5.6 Scaling and Aggregation .....</b>                                         | <b>157</b> |
| 5.6.1 Correlating Data Sets.....                                                 | 158        |
| 5.6.2 Cost Function Analysis When Scaling .....                                  | 159        |
| <b>5.7 A Heuristic Approach.....</b>                                             | <b>163</b> |
| 5.7.1 Genetic Algorithms .....                                                   | 164        |
| 5.7.2 Other Heuristic Algorithms .....                                           | 167        |
| <b>5.8 Mathematical Framework for Representing Agent-Based Models.....</b>       | <b>167</b> |
| <b>5.9 Translating Agent-Based Models into Polynomial Dynamical Systems.....</b> | <b>171</b> |
| 5.9.1 Basic Movement Function.....                                               | 171        |
| 5.9.2 Uphill and Downhill Movement.....                                          | 173        |

|                                                                                           |            |
|-------------------------------------------------------------------------------------------|------------|
| 5.10 Summary .....                                                                        | 175        |
| 5.11 Supplementary Materials .....                                                        | 176        |
| References.....                                                                           | 176        |
| <b>CHAPTER 6 Neuronal Networks: A Discrete Model.....</b>                                 | <b>179</b> |
| <i>Winfried Just, Sungwoo Ahn and David Terman</i>                                        |            |
| 6.1 Introduction and Overview.....                                                        | 179        |
| 6.2 Neuroscience in a Nutshell.....                                                       | 180        |
| 6.2.1 Neurons, Synapses, and Action Potentials .....                                      | 180        |
| 6.2.2 Firing Patterns .....                                                               | 181        |
| 6.2.3 Olfaction.....                                                                      | 182        |
| 6.2.4 Mathematical Models.....                                                            | 183        |
| 6.3 The Discrete Model.....                                                               | 183        |
| 6.4 Exploring the Model for Some Simple Connectivities .....                              | 189        |
| 6.4.1 Acyclic Digraphs .....                                                              | 190        |
| 6.4.2 Directed Cycle Graphs .....                                                         | 191        |
| 6.4.3 Complete Loop-Free Digraphs.....                                                    | 193        |
| 6.4.4 Other Connectivities.....                                                           | 195        |
| 6.4.5 Discussion: Advantages and Limitations<br>of the Approach in this Section .....     | 196        |
| 6.5 Exploring the Model for Some Random Connectivities.....                               | 197        |
| 6.5.1 Erdős-Rényi Random Digraphs.....                                                    | 197        |
| 6.5.2 Discussion: Other Models of Random Digraphs.....                                    | 201        |

## **CHAPTER 8 Metabolic Pathways Analysis: A Linear Algebraic Approach ..... 239**

*Terrell L. Hodge*

|       |                                                                                                                |     |
|-------|----------------------------------------------------------------------------------------------------------------|-----|
| 8.1   | Introduction .....                                                                                             | 239 |
| 8.2   | Biochemical Reaction Networks, Metabolic Pathways, and the Stoichiometry Matrix .....                          | 242 |
| 8.2.1 | Stoichiometric Matrix I: Nullspaces, Linear Dependence, and Spanning Sets .....                                | 242 |
| 8.2.2 | More on the Nullspace of the Stoichiometric Matrix: Spanning with Biochemical Pathways and Base Changing ..... | 251 |
| 8.2.3 | Conclusion .....                                                                                               | 256 |
| 8.3   | Extreme Paths and Model Improvements .....                                                                     | 258 |
| 8.3.1 | Downloading and Installing expa.exe .....                                                                      | 258 |
| 8.3.2 | Analyzing a Modeling Decision: Directed Graphs .....                                                           | 260 |
| 8.4   | Supplementary Data .....                                                                                       | 265 |
|       | References .....                                                                                               | 265 |

## **CHAPTER 9 Identifying CpG Islands: Sliding Window and Hidden Markov Model Approaches ..... 267**

*Raina Robeva, Aaron Garrett, James Kirkwood and Robin Davies*

|       |                               |     |
|-------|-------------------------------|-----|
| 9.1   | Introduction .....            | 267 |
| 9.1.1 | Biochemistry Background ..... | 267 |
| 9.1.2 | CpG Islands .....             | 268 |

|                                                          |            |
|----------------------------------------------------------|------------|
| 9.1.3 DNA Methylation in Cancer .....                    | 270        |
| <b>9.2 Quantitative Characteristics of the CpG</b>       |            |
| Island Regions and Sliding Windows Algorithms.....       | 270        |
| <b>9.3 Definition and Basic Properties of Markov</b>     |            |
| Chains and Hidden Markov Models.....                     | 274        |
| 9.3.1 Finite State Markov Chains.....                    | 274        |
| 9.3.2 Hidden Markov Models (HMMs) .....                  | 277        |
| 9.3.3 Viewing DNA Sequences As Outputs of a HMM .....    | 279        |
| <b>9.4 Three Canonical Problems for HMMs with</b>        |            |
| Applications to CGI Identification.....                  | 282        |
| 9.4.1 Decoding: The Viterbi algorithm.....               | 283        |
| 9.4.2 Evaluation and Posterior Decoding:                 |            |
| The Forward-Backward Algorithm .....                     | 289        |
| 9.4.3 Training: The Baum-Welch Algorithm.....            | 295        |
| 9.4.4 Post-Processing .....                              | 299        |
| <b>9.5 Conclusions and Discussion.....</b>               | <b>301</b> |
| <b>9.6 Supplementary Materials .....</b>                 | <b>302</b> |
| References.....                                          | 302        |
| <br><b>CHAPTER 10 Phylogenetic Tree Reconstruction:</b>  |            |
| <b>Geometric Approaches.....</b>                         | <b>307</b> |
| <i>David Haws, Terrell L. Hodge and Ruriko Yoshida</i>   |            |
| <b>10.1 Introduction.....</b>                            | <b>307</b> |
| <b>10.2 Basics on Trees and Phylogenetic Trees .....</b> | <b>310</b> |
| <b>10.3 Tree Space.....</b>                              | <b>318</b> |
| 10.3.1 Trees as Points .....                             | 318        |
| 10.3.2 Fitting Trees: A Distance-Based Approach .....    | 320        |
| 10.3.3 Tree Metrics and Tree Space .....                 | 324        |
| <b>10.4 Neighbor-Joining and BME.....</b>                | <b>329</b> |
| 10.4.1 Neighbor-Joining.....                             | 329        |
| 10.4.2 Balanced Minimum Evolution .....                  | 334        |
| <b>10.5 Summary .....</b>                                | <b>339</b> |
